(1) Tutti gli esercizi sono stati considerati artigiani. — (2) Esistono solo esercizi industriali.

Esercizi, addetti, forza motrice, alla data di censimento

B) CAPILUOGHI

APPENDICI

APPENDICE I

STATISTICA DELLE MACCHINE GENERATRICI DI ENERGIA E CALCOLO DELLA POTENZA UTILIZZABILE (1)

(Relazione del Direttore Generale dell'Istituto Centrale di Statistica Dr. A. MOLINARI)

§ 1. - Premessa e richiamo di nozioni elementari. — La statistica delle « forze motrici », o, più propriamente, delle macchine generatrici di energia e la determinazione della « potenza » installata o utilizzabile (di uno stabilimento, di un ramo d'industria, di una regione, dell'intero Stato) costituisce forse uno dei capitoli più trascurati della nostra statistica industriale. Eppure da quando il « motore » ha rivoluzionato l'industria e i trasporti (2) entrando persino nelle aziende domestiche, la statistica in questione avrebbe dovuto trovarvi un posto d'onore, come lo ebbe prima e intorno al 1900 (3).

Sebbene alcuni aspetti fondamentali della questione siano stati in altri Paesi studiati e sviscerati da tempo (4), debbono essere chiariti ancora diversi punti oscuri e colmate evidenti lacune. In realtà si è constatata e si constata tuttora la mancanza di idee chiare, frequenti confusioni e, talvolta, anche errori in pubblicazioni ufficiali. Talune delle stesse conclusioni fondamentali approvate ultimamente in materia dall' Istituto Internazionale di Statistica sono incomplete od inesatte (cfr. paragr. 19).

L'argomento che ci preme di trattare riguarda il calcolo di quella che si può chiamare « potenza utilizzabile » in uno stabilimento (industriale o non) e quindi anche in rami di attività (economica o non), nelle province o regioni e nell'intero Stato. Tale argomento costituisce di solito l'epilogo della statistica delle cosidette « forze motrici » vecchia ormai di più di un secolo (5). È quindi necessario ricordare brevemente l'oggetto e lo scopo di questa.

* * *

Prima ancora si ritiene però opportuno richiamare alcune *nozioni elementari* secondo l'idea che se ne è formata chi non è tecnico (6), per non lasciar nel-

---

(1) Per le questioni più strettamente tecniche mi sono stati larghi di informazioni : il Dott. Ing. LIBERO MOLINARI ; il Dott. Ing. CARLO ZAMMATTIO ; il Prof. Ing. LUIGI GHERADELLI del Servizio Idrografico del Ministero dei Lavori Pubblici ; l'Ing. PIETRO SILVA dell'UNFIEL. Per quanto riguarda le notizie raccolte in merito alle targhe applicate ai motori, cfr. § 3, nota (2), pag. 9*.

(2) Cfr. nota (1) a pag. 3* e nota (3) a pag. 7*.

(3) Cfr. nota (5).

(4) Cfr. in particolare : INSTITUT INTERNATIONAL DE STATISTIQUE, Bulletin, Tome IX, Session de la Haye, 1911, 1ère Livraison, LUCIEN MARCH, *La statistique internationale des forces motrices*, pag. 374, La Haye ; Tome XXVII, session de Mexico, 1933, 2e Livraison pag. 517, La Haye, 1934. Comunication de MICHEL HUBER, *La Statistique internationale des forces motrices*, pag. 100 ; Tome XXIX, session de Athènes, 1936 1e Livraison, rapport de M. HUBER, *La Statistique internationale des forces motrices*, pag. 212, Athènes, 1938, e 3e Livraison (discussione del rapporto Huber con contributo di LEPRINCE-RINGUET e di RIEMER) pag. 212, La Haye, 1937.

La questione è spesso trattata nelle *relazioni sui censimenti industriali* dei vari Stati e in particolare della *Germania, Svizzera, Regno Unito, Stati Uniti, Norvegia, Svezia*, che forniscono, nel corso del tempo anche elementi interessanti per l'evoluzione dei concetti e criteri di calcolo parallelamente al rapido diffondersi e del progredire della motorizzazione e del trasporto a distanza dell'energia.

(5) La Francia pubblicò la prima statistica annuale delle forze motrici a vapore nel 1839.

In Italia le prime notizie statistiche pubblicate sulle caldaie a vapore risalgono al 1878 (v. ELLENA, *Notizie statistiche su alcune industrie italiane*, Roma, Tipografia Eredi Botta, 1878). Successivamente furono raccolte notizie più particolareggiate sulle caldaie a vapore e sulle forze motrici dalla Direzione Generale della Statistica e pubblicate dal 1885 al 1900 nelle monografie di statistica industriale delle varie province e compartimenti. Nel 1890 fu pubblicata una statistica generale delle caldaie a vapore (MINISTERO AGRICOLTURA, *Statistica delle caldaie a vapore esistenti nel Regno*, Roma, 1890, Tipografia Eredi Botta) sulla base di notizie raccolte a partire dal 1883. (La legislazione relativa allo esercizio delle caldaie a vapore entrò in vigore il 15 maggio 1890). Una statistica sommaria allegata ad un disegno di legge sulla sorveglianza delle caldaie e dei recipienti di vapore, fu pubblicata al 1894. Una statistica completa delle forze motrici fu pubblicata nel 1900. (Cfr. MINISTERO d'AGRICOLTURA, INDUSTRIA E COMMERCIO, *Statistica delle forze motrici impiegate nell'agricoltura e nell'industria del Regno al 1° gennaio* 1899, Tipografia Nazionale G. Bertero).

Le statistiche delle forze motrici più complete sono generalmente ricavate dai censimenti industriali ed economici – che quasi mai (eccezion fatta per la Germania, dove i censimenti sono totalitari) abbracciano tutti gli esercizi industriali e artigiani e raramente tutte le branche o categorie di attività economiche – o dalle statistiche della produzione. Altre si ricavano da statistiche amministrative di uffici od enti (per il controllo delle caldaie a vapore, per la tassazione o immatricolazione degli autoveicoli, ecc.).

(6) Per chiarire la questione si semplificano concetti e questioni usando termini ed espressioni forse tecnicamente imprecise pei quali chiediamo venia ai tecnici. L'importante è di evitare, da parte di statistici non versati in materia, errori gravi nel preparare o usare statistiche d'importanza fondamentale per lo Stato. La semplificazione dei concetti e delle espressioni mirano a spiegare, da una parte, la portata dei quesiti posti nei questionari statistici (quasi sempre con il concorso di tecnici) e, dall'altra, il procedi-

l'ombra concetti basilari che, erroneamente interpretati, potrebbero inficiare le conclusioni alle quali si è giunti.

Nel richiamare i concetti suddetti riteniamo opportuno cominciare a riferirci al caso più importante, presente alla mente di tutti, di uno stabilimento industriale propriamente detto che per esercitare la propria attività si avvalga del «lavoro» eseguito dal macchinario (non mosso a mano o con forza animale) installato nello stabilimento stesso.

Perchè il macchinario possa funzionare, produrre cioè il desiderato effetto industriale, deve essere messo e mantenuto in movimento. Ciò si ottiene fornendogli energia meccanica o motrice. Il lavoro prodotto dalle macchine corrisponde all'energia consumata, l'uno e l'altra misurati in chilogrammetri (kgm). Un chilogrammetro è il lavoro necessario per sollevare, verticalmente, un kg ad un metro di altezza.

La capacità di produrre una maggiore o minore quantità di lavoro nell'unità di tempo si chiama *potenza* e si esprime in cavalli vapore (CV) (1) o in chilowatt (kW). Un cavallo vapore corrisponde ad un lavoro di 75 kgm al secondo.

Un motore di un CV produrrà quindi 75 kgm di energia al secondo, che viene trasmessa e consumata dal macchinario per eseguire l'identico lavoro di 75 kgm/sec (2). Questa identità è soltanto teorica; perchè vi sono in realtà *perdite* dovute alle resistenze passive (attrito, resistenza del mezzo, ecc.), che, ai fini statistici del calcolo in questione, supponiamo non esistano, così come, in generale, si fa astrazione dalle perdite dovute alle trasformazioni della energia nelle sue varie forme (meccanica, elettrica, ecc.) e al loro trasporto (cfr. paragr. 20).

La potenza complessiva che occorre fornire al macchinario installato nello stabilimento per farlo funzionare è tratta da energie naturali — potenziali o vive — dell'acqua, del vento dei combustibili o dei carburanti, solidi, liquidi o gassosi, ecc. Gli organi o macchine incaricati di trasformare le energie naturali in energia di movimento o meccanica si chiamano motori *primari*. La trasformazione può avvenire direttamente (e l'energia può venire trasmessa alle macchine) o anche attraverso varie preliminari trasformazioni (passando, p. es. dall' energia termica attraverso l'energia potenziale elastica del vapore). L'energia meccanica prodotta dai motori primari viene trasmessa in vari modi alle macchine che l'assorbono, la consumano. La trasmissione dell'energia meccanica, prodotta dai motori primari, al macchinario può, in tutto o in parte, avvenire in modo *diretto* e meccanico mediante puleggie applicate all'albero del motore, con funi e cinghie di trasmissione, alberi di trasmissione, accoppiamento d'assi, giunti, snodi, ingranaggi, ecc.

Ma la trasmissione dell'energia meccanica dal motore primario al macchinario può compiersi, anzichè in modo diretto (con mezzi puramente meccanici), in modo *indiretto*, pel *tramite* di un *motore secondario*, che è il *motore elettrico* per la quasi totalità dei casi. Usando questo sistema, l'energia meccanica sviluppata dal motore primario viene prima trasformata mediante una macchina elettrica (*generatore elettrico* o generatore di corrente) in energia elettrica, la quale viene trasmessa al motore elettrico che la ritrasforma in energia meccanica da trasmettere al macchinario (macchine, apparecchi, attrezzi o utensili meccanici ai quali è accoppiato) per metterlo e mantenerlo in azione. Il motore elettrico (e generatore) potrebbe paragonarsi alla cinghia di trasmissione che collega l'albero del motore primario a quello della macchina.

Questa apparente complicazione non è in definitiva che un sistema di trasporto di energia, ed ha il vantaggio enorme di poter trasmettere l'*energia a distanza* e di suddividerla in molteplici parti. Il macchinario, che un tempo doveva essere collocato nelle immediate vicinanze del motore primario — al quale veniva accoppiato meccanicamente — può, invece, con questo sistema, essere installato anche a grande distanza. In tal modo, altresì, gli stabilimenti possono anche rinunciare a installare nel proprio seno motori primari. Questi vengono installati nel luogo più favorevole per lo sfruttamento dell'energia naturale, cioè per la trasformazione sul

---

segue nota 6

mento per giungere a valutazioni, sia pure largamente approssimative, dei risultati e a interpretare questi correttamente. Va subito avvertito che non è possibile pervenire a risultati precisi, non perchè ciò non sia teoricamente possibile, ma perchè in occasione di censimenti o statistiche estese a masse di esercizi occorre limitarsi a pochi quesiti fondamentali che, oltre a riuscire facilmente comprensibili anche ai più modesti artigiani o ai compilatori dei questionari (che sono più spesso dei contabili o degli impiegati digiuni di cognizioni tecnico-statistiche), si limitano a richiedere dati e notizie a portata di mano senza costringere a ricerche, a calcoli o lavori particolari. L'esperienza dimostra come (a prescindere dalla maggiore onerosità degli spogli) richiedendo notizie più particolareggiate e di difficile approntamento non si raggiunga lo scopo.

(1) Nel corso del presente lavoro abbiamo sempre usato il simbolo CV (cfr. *Manuale dell'Ingegnere* di G. Colombo, 70ª edizione Milano 1939, Hoepli) ma recentemente la Commissione Tecnica di Unificazione dell'Automobile, che ha elaborato un progetto di simboli delle unità di misura, ha raccomandato, in linea generale (previo accordo di massima con gli interessati) l'uso del simbolo Cv (cfr. Anfia, *Progetti e tabelle di unificazione*, Supplemento 1942 Anno XX. Torino, 1942, pag. 173), anche per evitare l'uso di «V» abbreviazione di «Volt» ad es.; nelle unità di misura kV, chilovolt, e kVA, chilovoltampère. La raccomandazione è stata inoltrata all'apposita Commissione dell'UNI che sta esaminando la proposta.

(2) La «potenza» di un uomo è in media di 1/10 CV, quella di un cavallo varia da 0,5 a 1 CV.

posto in energia meccanica che i generatori elettrici trasformeranno (sempre sul posto, nelle cosidette « centrali elettriche ») in energia elettrica. Questa viene poi trasmessa a distanza agli stabilimenti (nella quantità a ciascuno di essi occorrente) dove i motori elettrici in essi installati la ritrasformeranno in energia meccanica per azionare il macchinario (1).

La potenza complessiva dello stabilimento (cfr. paragr. 4) costituisce (nelle aziende che usano esclusivamente o in abbondanza forza motrice) un indice della *capacità di produzione*. Così come è un indice di *capacità* produttiva il numero degli operai industriali disponibili in uno Stato o occupati nelle aziende che si avvalgono in modo esclusivo o prevalente di lavoro manuale. Il dato in parola non costituisce pertanto un indice della *produzione effettiva*. Questa può invece essere messa in relazione con l'*energia consumata*, espressa in cavalli-vapore-*ora* (CVh) o in chilowatt*ora* (kWh), così come si metterebbe in relazione detta produzione effettiva con le *ore di lavoro* prestate dagli operai. « Potenza » e mano d'opera destinate ad azionare il macchinario industriale, sono due elementi indispensabili delle statistiche tratte dai censimenti industriali, così come i kWh consumati e le ore di lavoro eseguite sono indispensabili per le statistiche della produzione. La potenza, in altre parole, indica la *possibilità*, di produrre energia, cioè di compiere un lavoro. Possibilità potenziale, o capacità, che esiste tanto per il motore in azione per 24 ore al giorno e 365 giorni all'anno quanto per il motore in riserva o inattivo.

Un motore primario e rispettivo generatore accoppiato (gruppo) di 100 kW che « lavorino » per 10 ore si può supporre, teoricamente, abbiano prodotto 1.000 kWh (100 × 10) di energia elettrica. Questa

---

(1) Vale la pena di riportare quanto con estrema chiarezza scrive GIUSEPPE REVESSI (*Enciclopedia italiana*, alla voce « Elettrica, energia », vol. XIII, pag. 636, Roma, 1932) al riguardo: « Nel caso, poi, dell'energia idraulica, che l'uomo utilizzava da secoli, sebbene in scala ridotta, la necessità di rimanere attaccati con la macchina operatrice all'impianto motore confinava i molini, le segherie, le cartiere nell'ombra e nell'umidità delle gole più anguste, e costringeva a lasciare inutilizzate le disponibilità di maggiore importanza.

Tutto ciò perchè, se era risolto nelle linee fondamentali il problema della produzione di energia sia con macchine termiche sia con macchine idrauliche, il problema complementare della trasmissione e della distribuzione dell'energia prodotta era ancora lungi dall'essere risolto. Esso non poteva essere allora affrontato che meccanicamente e, pure nell'ambito di un singolo stabilimento, con enorme sperpero di energia e con un ingombro ancora maggiore. Chi voleva portare la macchina operatrice a qualche centinaio di metri dalla motrice doveva ricorrere a complicate trasmissioni a fune metallica e a costosissime trasmissioni idrodinamiche per raggiungere l'eccezionale limite di qualche chilometro.

Con lo sviluppo crescente delle industrie si incominciarono a utilizzare le reti di tubazione del gas illuminante per alimentare motori a scoppio, di esercizio costoso e incomodo.

L'elettricità, a partire dagli ultimi decenni del secolo scorso, ha risolto definitivamente e completamente il problema di fornire l'energia a domicilio dell'utente e ha dato inoltre nuovo e più vigoroso impulso *al passaggio dalla civiltà a base manuale all'attività a base meccanica dei nostri giorni*.

Prima dell'avvento industriale dell'elettricità, per muovere un argano con la motrice posta a una certa distanza, sarebbe occorso munire motrice e argano d'una puleggia e riunire le due puleggie con una cinghia. Oggi, invece, si monterebbe sull'asse della motrice, una dinamo, si accoppierebbe all'argano, preferibilmente attraverso un riduttore di velocità, un motore elettrico e si completerebbe il circuito fra generatore e motore con un conveniente numero di conduttori. Messo in funzione il gruppo generatore e avviato il motore tutto avverrebbe come quando motrice e argano erano accoppiati per cinghia: come allora, a seconda del carico da sollevare, la motrice tenderebbe ad essere più o meno frenata e, supposta costante la velocità per l'azione di un adatto regolatore, svilupperebbe una potenza più o meno grande, ma automaticamente corrispondente a quella richiesta dall'argano.

In tal modo — sebbene con maggior complicazione di organi, maggiore spesa d'impianto, maggior onere di sorveglianza e di manutenzione — la distanza interposta può essere senza confronto maggiore e il cammino da compiere comunque accidentato; sopratutto il medesimo gruppo generatore può servire contemporaneamente a migliaia di lampade e di macchine diverse e, finalmente, ciascuna di queste macchine e di queste lampade può essere messa in funzione o fermata o spenta con la manovra più semplice e senza interferire praticamente col funzionamento delle altre. E se poi il gruppo finisce per diventare insufficiente, è possibile affiancargliene un secondo, anche distante centinaia di chilometri, senza affatto variare le condizioni di utilizzazione delle macchine e delle lampade. Inoltre, l'indipendenza di funzionamento accennata permette di distinguere il consumatore dal produttore e dal distributore, tutto riducendosi, nel caso più comune, al pagamento da parte dell'utente dell'energia consumata.

Si è fatto incidentalmente parola di lampade, e difatti

segue nota 1

gli impianti elettrici, come al loro tempo le distribuzioni di gas, hanno iniziato la loro esistenza col servizio dell'illuminazione che al principio era considerata un lusso, ma poi è diventata un'esigenza comune contribuendo potentemente allo sviluppo degli impianti elettrici anche in quelle zone dove difficilmente avrebbero potuto sorgere per mancanza di un'adeguata richiesta di energia elettrica per forza motrice.

Questa attitudine dell'elettricità a trasmettere e a distribuire l'energia e a trasformarsi in seguito agevolmente in energia meccanica, in luce o in calore permettendo la *concentrazione* della produzione dell'energia in centrali termoelettriche sempre più grandiose e l'utilizzazione di forze idrauliche altrimenti trascurate perchè o troppo ingenti o troppo remote, ha messo a disposizione del mondo civile quantitativi mai visti d'energia, non più soltanto a beneficio della grande industria, ma anche del più modesto artigianato e della generalità della popolazione.

Si pensi che, tenendo conto della sola energia prodotta negli impianti elettrici — astraendo quindi da quella individualmente messa in gioco con macchine termiche nella trazione a vapore, nella navigazione, nell'automobilismo, nella aviazione — l'energia per abitante e per anno si avvicina in Italia a 300 kWh. Supera cioè quella che può sviluppare un uomo robusto, che ogni giorno faccia un arrampicata di 4.000 m. ed è certamente almeno decupla di quella sviluppata dal complesso della popolazione. Si pensi che il consumo medio annuo per abitante supera in alcuni Paesi (sopratutto in conseguenza dell'esercizio di grandi industrie elettrotermiche) per es. in Svizzera, in 1.000 kWh per abitante. Anche esteso il computo alla popolazione mondiale non si va lontano dai 100 kWh. Ciò spiega la *profonda trasformazione che il mondo ha subìto ad opera degli impianti elettrici negli ultimi 50 anni* ».

stessa quantità di chilowattore può essere prodotta da un « gruppo » di 10 kW che abbia « lavorato » per 100 ore. Questa osservazione mostra, incidentalmente, come il passaggio dal dato, supposto noto, di kWh (produzione effettiva) al dato supposto ignoto dei kW (potenza) non sia possibile se non si conoscono almeno le ore di erogazione o di « lavoro » del gruppo. Ma in pratica il passaggio da kWh a kW urta contro difficoltà spesso insormontabili (cfr. paragr. 9, pag. 30*).

Da quanto si è detto risulta che i « motori » (primari e secondari) non sono che delle « macchine » speciali cui viene applicata una qualsiasi energia inorganica che esse trasformano in *movimento* o *moto*.

Il motore primario è l'unico *produttore* originario di energia meccanica (a spese delle energie naturali), il generatore è un *trasformatore* di detta energia meccanica in elettrica (consuma energia meccanica e sviluppa energia elettrica), il motore elettrico è un *successivo trasformatore* di energia elettrica in energia meccanica (consuma energia elettrica e sviluppa energia meccanica). Generatori e motori elettrici sono entrambi dei « produttori » *secondari* o *derivati*, cioè dei semplici elaboratori dell'energia meccanica primaria. La loro possibilità di sviluppare energia, rispettivamente elettrica o meccanica, è condizionata alla produzione di energia meccanica primaria. Essi presuppongono cioè l'esistenza all'*origine* di motori primari (di potenza pressocchè uguale) che li alimentino *direttamente* (generatori) o *indirettamente* pel tramite dei generatori (motori elettrici). L'energia è esterna al motore o al generatore - cioè non si crea in essi - i quali non fanno che trasformarla.

I « motori » primari e secondari sono dotati di una *potenza « motrice » o meccanica* cioè di una capacità di sviluppare energia meccanica. I generatori sono dotati di una *potenza elettrica*, cioè di una capacità di sviluppare energia elettrica.

La potenza, sia meccanica che elettrica, si può esprimere indifferentemente in CV e kW, cioè in unità di misura meccanica o elettromagnetica, poichè dette unità stanno fra di loro in un rapporto fisso. I motori *primari* non comprendono soltanto i motori « installati » o « fissi », fissati cioè più o meno saldamente al suolo in un'azienda (industriale o non), ma anche i motori « mobili » dei mezzi di trasporto non elettrici (locomotive a vapore, automobili, natanti, aeroplani).

Anche i motori *elettrici* possono essere « fissi » e « mobili » (dei mezzi di trasporto : motrici di tramvie e ferrovie elettriche ecc.).

I motori elettrici possono essere azionati tanto *sul posto* con energia elettrica prodotta nello stesso stabilimento (nel quale siano installati anche il motore primario e relativo generatore) quanto *a distanza* (con energia elettrica prodotta fuori dello stabilimento). Essi sono destinati ad azionare soltanto il macchinario (1) sul posto (o muovendosi con questo, nel caso di trazione elettrica).

L'energia prodotta dai motori primari ha invece due destinazioni : o azionare direttamente il macchinario *sul posto* (o muovendosi con questo, nel caso di autovetture) o ad azionare sempre *sul posto*, i generatori elettrici.

L'energia elettrica prodotta dai generatori elettrici ha due destinazioni in quanto serve ad alimentare *sul posto o a distanza* : *a*) dei motori elettrici ; *b*) delle installazioni elettriche : impianti luce, forni elettrici, batterie di elettrolisi ecc.).

* * *

La potenza meccanica del motore primario può essere *utilizzabile* nello *stabilimento* stesso presso cui è installato, cioè *sul posto* :

a) *integralmente*, come potenza meccanica : quando aziona direttamente il macchinario oppure quando destina *tutta* l'energia elettrica del generatore cui è accoppiato ad alimentare motori elettrici installati nello stabilimento. (Naturalmente, in questo caso, la potenza utilizzabile dallo stabilimento può essere conteggiata considerando o soltanto la potenza del motore primario oppure soltanto quella del generatore o soltanto quella dei motori elettrici, ma non l'una e l'altra) ;

b) *integralmente*, come potenza elettrica : quando impiega l'energia elettrica prodotta dal generatore, cui è accoppiato, per usi diretti dello stabilimento stesso (illuminazione, usi termici, usi chimici) ;

c) *integralmente*, ma come impiego misto di potenza meccanica e di potenza elettrica, quando il motore primario aziona, alternativamente o contemporaneamente, il macchinario — direttamente — e il generatore elettrico (la cui energia elettrica sviluppata viene destinata ad alimentare installazioni elettriche interne).

d) *parzialmente* e solo come potenza meccanica quando una parte della potenza del motore primario viene destinata ad alimentare generatori elettrici la cui energia prodotta viene tutta trasportata a distanza (vendita di energia) e l'altra parte viene destinata ad azionare direttamente il macchinario ;

(1) Qui si considera che i mezzi di trasporto siano compresi fra il « macchinario », ma successivamente nel testo saranno esclusi.

e) *parzialmente* e solo come potenza elettrica, quando il motore primario è accoppiato ad un generatore elettrico la cui energia elettrica prodotta viene in parte impiegata per usi *diretti* interni e l'altra parte viene venduta;

f) *parzialmente*, come impiego misto di energia meccanica e di energia elettrica, quando si verificano insieme e parzialmente le circostanze indicate ai due punti *d*) ed *e*);

g) *nemmeno in parte* quando il motore primario è destinato soltanto ad azionare generatori elettrici la cui energia elettrica viene *tutta* venduta.

Se si vuol considerare la forma *finale* di utilizzazione della energia meccanica prodotta originariamente dal *motore primario*, a seconda del luogo nel quale avviene l'utilizzazione stessa e la natura della potenza assorbita, avremo le seguenti cinque possibilità:

A) Utilizzazione finale *sul posto*
1) azionamento diretto del macchinario (potenza meccanica);
2) azionamento del macchinario a mezzo del motore elettrico, tramite il generatore (potenza meccanica);
3) alimentazione diretta delle installazioni elettriche interne, tramite il generatore (potenza elettrica);

B) Utilizzazione finale *a distanza*
4) azionamento del macchinario a mezzo del motore elettrico, (potenza meccanica);
5) alimentazione diretta delle installazioni elettriche (potenza elettrica).

L'energia meccanica originaria può quindi essere ritrovata, alla fine, sul posto o a distanza, come energia meccanica o come energia elettrica.

Il *generatore elettrico* può: *a*) azionare motori elettrici installati sul *posto o a distanza*: l'energia elettrica prodotta dal generatore si ritrova *alla fine* come energia meccanica; *b*) alimentare direttamente installazioni elettriche *sul posto e a distanza*.

Per i *motori elettrici*, invece, l'energia meccanica da essi sviluppata è sempre e tutta utilizzabile soltanto *sul posto* ed esclusivamente per azionare il macchinario.

* * *

Passando dai motori o generatori, considerati quali singole unità statistiche separate, all'unità statistica «stabilimento» (o «esercizio», industriale o non), troviamo che questo può utilizzare:

a) *energia meccanica* per azionare le *installazioni meccaniche*: macchinari in senso lato (macchine operatrici, utensili; attrezzi; ed anche *mezzi di trasporto* azionati da motori non elettrici). Detta energia meccanica assorbita dallo stabilimento può essere:

- primaria, quando è prodotta *sul posto* da un motore primario «fisso» (o «mobile») accoppiato direttamente al macchinario (o al mezzo di trasporto);
- secondaria, quando è fornita da un motore elettrico «fisso» (installato nello stabilimento) o «mobile» (per trazione elettrica) che riceve energia elettrica, prodotta *sul posto* o *a distanza* (acquistata). Fra il motore primario (installato nello stabilimento o, a distanza, in altro stabilimento) e l'installazione meccanica o macchinario vi sono sempre in questo caso *due mezzi intermediari*: il generatore (sul *posto o a distanza*) ed il motore elettrico (sul posto).

b) *energia elettrica* per alimentare le *installazioni elettriche* (impianti di illuminazione, forni elettrici, batterie elettrolitiche, ecc.). L'energia elettrica può essere prodotta *sul posto*, nello stesso stabilimento o *a distanza* (acquistata). Fra il motore primario (installato sul posto o, a distanza, in altro stabilimento) e l'installazione elettrica vi è *un solo mezzo intermediario* (1): il generatore (installato sul posto o a distanza).

Avuto riguardo allo stabilimento (o esercizio) e alle *installazioni ultime consumatrici* di energia (meccanica — primaria o secondaria — od elettrica) vi è quindi una differenza fra il «macchinario» e le altre «installazioni consumatrici» in quanto:

a) al *macchinario* fa *sempre* riscontro sul *posto* il produttore dell'energia meccanica (primaria o secondaria) che lo aziona e la cui capacità produttrice o potenza, facilmente rilevabile sul posto stesso, si può, per comodità, supporre equivalente alla «capacità consumatrice» del macchinario stesso;

b) alle *altre installazioni consumatrici* (di energia elettrica) non sempre fa riscontro *sul posto* il produttore (generatore) dell'energia elettrica che lo alimenta. Più spesso, anzi, il produttore ultimo dell'energia elettrica consumabile è posto *fuori* dello stabilimento. Date le caratteristiche dell'estrema suddivisibilità dell'energia elettrica non è dato in questo caso di conoscere per lo stabilimento, e rilevare quindi direttamente, la potenza da attribuire al presumibile generatore di energia elettrica corrispondente alla capacità consumatrice delle installazioni stesse.

In altre parole, mentre per il macchinario, la po-

(1) Si prescinde, qui, dai trasformatori statici e dai gruppi di conversione, intercalati fra generatore e installazione elettrica.

tenza consumatrice o capacità di consumo è deducibile da quella del motore primario che l'aziona direttamente o da quella dei motori elettrici (potenza rilevabile sul posto dalla targa dei motori o altrimenti), per le altre installazioni consumatrici la capacità di consumo deve essere determinata: *a)* per *via diretta*, basandosi sulla potenza che o figura direttamente inscritta sull'installazione stessa (per es. sui forni elettrici, sulle lampadine elettriche, ecc.) o che è altrimenti nota al consumatore; *b)* o per *via indiretta*: 1) passando, mediante calcolo, dai kWh consumati (o *consumabili*) — oppure, nel caso di elettrolisi, dal prodotto ottenuto: mc di idrogeno, kg di soda, ecc. — alla potenza in kW teoricamente corrispondente; 2) ricavandola in altro modo indiretto o congetturale.

* * *

Idealmente si può supporre che la potenza dei motori primari sia uguale a quella dei generatori elettrici (1) da essi alimentati e questa sia a sua volta eguale a quella dei motori elettrici azionati e alla potenza o capacità consumatrice del macchinario o delle altre installazioni consumatrici.

Questa identità teorica o ideale viene assunta anche come identità pratica ai fini statistici del presente studio e su di essa si tornerà (cfr. paragrafo 20).

§ 2. - Dalla statistica delle « forze motrici » alla statistica delle « macchine produttrici di energia » (meccanica ed elettrica). — Fino a quando il motore elettrico non venne esteso su larga scala agli stabilimenti industriali la « statistica delle forze motrici » era limitata ai motori *primari* (forze *motrici* a vapore, idrauliche, a gas povero, ecc.) che azionavano direttamente il macchinario.

Quando si trovò modo di trasformare — a mezzo del generatore — l'energia meccanica prodotta dal motore primario in energia elettrica e questa potè anche essere trasportata a distanza la statistica delle forze « motrici » si estese anche al *motore elettrico*.

(1) La potenza dei generatori è espressa o in kW (per le dinamo o generatori a corrente continua (o a corrente alternata sincroni) o in kVA (chilovoltampère) per i generatori a corrente alternata. In media: 1 kVA = 0,8 kW (dato medio approssimativo). L'Istituto Internazionale di Statistica nella sua riunione di Atene del 1936 (cit.) nelle raccomandazioni votate così si esprime « 5° pour les besoins de la statistique, on réduira conventionnellement la puissance en kilowatt sur la base de 1 kilovoltampère = 0,8 kilowatt » (pag. 104).

Detta statistica — che aveva legato il suo nome, fin dall'origine, alle macchine o forze « motrici » — solo molto più tardi (2) si estese anche ai generatori elettrici. Questi però, non sviluppando energia cinetica o di *moto*, male si adattano ad essere compresi nella statistica delle forze « motrici ». Oggi una statistica completa deve estendersi anche ai generatori che costituiscono una « macchina elettrica », non sostanzialmente diversa dal motore elettrico. Abbiamo già detto come motore elettrico e generatore non sono che delle « macchine » trasmettitrici, e al tempo stesso trasformatrici, dell'energia originariamente prodotta dal motore primario.

Se si ha riguardo soltanto all'origine *prima* della « forza » o « energia » prodotta si tratterà sempre soltanto di « energia meccanica » o « forza motrice » *primaria*, ma, dal momento che si tiene conto delle successive trasformazioni di questa, hanno lo stesso titolo di essere considerate dalla statistica tanto le « macchine elettriche » che ritrasformano detta energia elettrica in energia meccanica (motori elettrici). quanto le « macchine elettriche » che effettuano la prima trasformazione dell'energia meccanica in energia elettrica (generatori elettrici).

Va tuttavia osservato che la limitazione delle rilevazioni statistiche alle sole « forze motrici » installate, propriamente dette, e quindi al calcolo della sola *potenza meccanica* è giustificata quando si consideri *un solo aspetto*, sia pure importante, della questione, e precisamente il fatto che il « lavoro » delle « motrici » (primarie o secondarie) viene trasmesso al macchinario, e questo può produrre un effetto industriale, che un tempo era ottenuto prevalentemente dal *lavoro muscolare* dell'uomo (o dell'animale). Importava quindi (come importa del resto tuttora) determinare, soprattutto per le industrie vere e proprie, quanta parte del lavoro umano era sostituito o integrato (e accresciuto) dal lavoro meccanico delle macchine (3).

(2) In Francia, ad es., solo a partire dal censimento del 1931, in Italia solo nel censimento 1937-40.

(3) Filippo Tajani (*Il libro dell'energia*, Soc. Editrice Internazionale, Torino, 1942), fa osservazioni oltremodo interessanti a questo riguardo.

Dopo aver premesso (pag. 3) che « la parola « energia » pare sia nata in Grecia. Aristotele sarebbe stato il primo ad usare quel sostantivo in senso scientifico. Egli concepiva il mondo sensibile come il risultato di un perenne contrasto tra potenza e possibilità (*dinamis*) ed attività (*energheia*)» osserva: « L'uomo costituisce una macchina motrice composta di un grandissimo numero di elementi. Le sue innumerevoli parti sono altrettanti congegni complicatissimi di fronte ai quali le macchine artificiali più complesse sono veri giocattoli. La più ingegnosa fra le macchine, lavorando da sola e senza diretto intervento dell'uomo, non fa che ripetere ciecamente all'infinito l'identica serie di operazioni, allo stesso modo che il ruscello, irrompendo dalla montagna continua per secoli a scavare il suo letto. Dal punto di vista termodinamico il motore animato è un motore a combustione interna ».

L'importanza di uno stabilimento industriale non poteva più essere — come si faceva spesso e come si fa tuttora — giudicata dal solo impiego di mano d'opera, ma anche — o soltanto — dalla potenza meccanica utilizzabile dallo stabilimento stesso a mezzo dei motori primari ed elettrici.

Poichè l'impiego dell'energia meccanica del motore primario per produrre energia elettrica (a mezzo del generatore) impiegata soltanto per usi diretti (illuminazione, usi termici e chimici) era inizialmente limitato e di non grande rilievo non parve il caso di introdurre modificazioni all'oggetto della statistica delle forze « motrici ». Gli statistici si limitarono ad escludere dalle « motrici » i motori primari accoppiati ai generatori. Ma con l'impiego sempre più importante dell'energia elettrica nelle industrie per usi diretti: termici (forni elettrici delle industrie siderurgiche, delle industrie vetrarie, delle ceramiche, smalterie, industrie chimiche e farmaceutiche, alimentari — per pane, pasta e pasticceria e cottura in genere — nelle saldature autogene, ecc.); elettrochimici (elettrolisi di acqua e soluzioni chimiche; fusioni, ecc.) e per illuminazione, la potenza dei motori primari installati per questi scopi (circa un terzo in Italia di tutta la potenza primaria installata) non poteva e non può essere trascurata per giudicare dell'*importanza* dei diversi stabilimenti e rami d'industria. Tali usi diretti sono oggi talmente estesi nelle industrie e nelle attività non industriali da superare talvolta per importanza (avuto riguardo sia alla potenza dei motori primari impiegati a produrla, sia alla quantità di energia consumata) quello relativo alla sola « forza motrice » (cfr. paragr. 12).

L'estensione della statistica, dalle sole « forze motrici » (primarie e secondarie) — quale era all'origine — alle « forze elettriche » sviluppate, non è soltanto logica dal punto di vista della produzione e dell'impiego della potenza dei motori (corrispondenti all'energia da essi sviluppata) ma risponde anche ad una necessità pratica.

L'impiego diretto di energia elettrica, pur non costituendo un succedaneo o un complemento del lavoro umano, produce un *effetto industriale* che, nei molteplici processi di trasformazione delle materie lavorate, non può essere considerato diversamente da quello del « moto » delle macchine operatrici od utensili. Sia l'energia meccanica che quella elettrica, impiegata, derivano d'altronde, l'una e l'altra, da una potenza meccanica delle « forze motrici » primarie.

Uno stabilimento siderurgico che abbia installato un motore primario di 1000 kW accoppiato ad un generatore di pari potenza, per destinare l'energia elettrica prodotta direttamente ai forni elettrici, deve — rispetto al calcolo della potenza — avere lo stesso rango di uno stabilimento che destina lo stesso motore primario di 1000 kW, pure accoppiato ad un generatore, ad azionare, con l'intermediario dei mo-

---

segue nota 3

A proposito del rapporto fra lavoro umano o animato e lavoro inanimato scrive: « Dato che, con calcoli sommari i quali troveranno nelle pagine seguenti una maggiore precisazione, un chilo di carbone corrisponda a un chilowattora e un chilo di petrolio (nafta, benzina e prodotti similari) a due chilowattora in media (occorre cioè, nella produzione termoelettrica, bruciare un chilogrammo di carbone per chilowattora, mentre un chilo di benzina contiene maggior numero di calorie e queste si trasformano con minori perdite in lavoro meccanico) l'Italia che compera all'estero dodici milioni di tonnellate di carbone fossile, 2.600.000 tonnellate di oli minerali all'anno (1938) e produce in patria 15 miliardi di energia elettrica, consuma in totale 32 miliardi di chilowattora di energia di ogni genere. Si calcola che ad ogni giornata di lavoro umano corrispondano 2 chilowattora: *il consumo totale di energia equivale a 16 miliardi di giornate.* E' dunque come se ogni abitante del Regno avesse dietro di sè tanti invisibili compagni che lavorano con lui e per lui. Se si suppone che un uomo lavori 100 giorni all'anno in media, questi compagni ammontano a 160 milioni: ne avremmo, dunque, noi 45 milioni di italiani, circa 3,5 a testa. A questo risultato dovremmo aggiungere la produzione energetica dei combustibili e dei carburanti nazionali, che rappresentano una piccola percentuale del consumo totale. Non lo facciamo perchè gli antichi dati forniscono un'impressione di grande scarsezza, mentre dopo l'impulso dato dal fascismo allo sfruttamento del sottosuolo, le quantità rientranti sotto questo titolo vanno crescendo e non è ancora giunta l'ora di farne un esatto censimento. Da un calcolo analogo il fisico Gustavo Le Bon, prima della guerra 1914-18 desunse che la Germania, estraendo ogni anno 190 milioni di tonnellate di carbone dalle sue miniere, ne ricavasse un lavoro meccanico pari a quello che avrebbero potuto compiere 950 milioni di operai ».

« Un'osservazione del genere era già stata fatta da Arago, circa un secolo addietro, quando non si conosceva che la macchina a vapore. Egli calcolava che un moggio di carbone bruciato nelle macchine della regione di Cornovaglia produceva un lavoro pari a quello di 20 uomini occupati per 10 ore. A quell'epoca un moggio di carbone costava 90 centesimi. La macchina di Watt aveva permesso dunque di ridurre il costo di una giornata di lavoro a meno di 5 centesimi. Dopo un tale risultato — concludeva lo scienziato francese — si può ritenere che le macchine a vapore esistenti in Inghilterra rimpiazzino 30 milioni di uomini ».

GIUSEPPE REVESSI (*loc. cit.*) scrive: « L'energia meccanica di cui per natura dispone l'uomo è ben poca. Un motore elettrico che assorba un quarto di kWh di energia elettrica compie, all'incirca, il lavoro massimo che può essere compiuto in una giornata lavorativa da un uomo valido e di buona volontà il quale muova una macchina — per es. un argano — rimanendo in condizioni di poter riprendere il lavoro per un gran numero di giorni successivi. Per brevi periodi e in condizioni particolarmente favorevoli l'uomo è in grado di fornire un lavoro maggiore che, però, in una giornata lavorativa raramente supera quello di un motore che assorba 0,8 kWh. Nelle società che sapevano utilizzare soltanto il lavoro umano e quella degli animali domestici — tenuto conto delle donne, dei vecchi e dei bambini che non potevano assolutamente fornire un lavoro paragonabile a quello dell'uomo valido — era molto se ogni abitante disponeva in media di 1/10 di kWh al giorno ».

« Fu soltanto nel secolo passato che la macchina a vapore cominciò a cambiare veramente la faccia del mondo, affiancando utilmente l'energia manuale; però soltanto nella grande industria, solo cioè dove era possibile, per il bisogno di potenze ingenti in brevissimo spazio, di provvedere localmente all'installazione e all'esercizio di un impianto a motore ».

tori elettrici, le macchine utensili. Attribuire al primo una potenza di zero kW e al secondo di 1000 kW sarebbe, manifestamente, un errore. Il fatto che nel secondo caso la potenza primaria integra o sostituisce la mano d'opera e nel primo caso no, non è motivo sufficiente per una esclusione. La diversa natura dell'utilizzazione di un'energia (prodotta all'origine sempre a spese di energia naturale) non può influire sulle statistiche se non per distinguere i diversi impieghi della potenza nelle due grandi classi, « per azionare il macchinario » (« forze motrici ») e per « altri usi », senza peraltro rinunciare a rilevare e calcolare il dato della potenza *complessiva* (meccanica ed elettrica), *qualunque sia la destinazione finale* dell'energia sviluppata. Anzichè statistica delle forze « motrici » e calcolo della « potenza meccanica » è pertanto più opportuno parlare oggi rispettivamente di una « *statistica delle macchine produttrici di energia* » meccanica o elettrica, e del calcolo della « potenza » o più semplicemente di « statistica dell'energia » (senza l'aggiunta, limitatrice, di « meccanica » o « motrice » o simili). La statistica delle sole forze « motrici » e il calcolo della sola potenza « meccanica » costituiscono pertanto uno soltanto degli scopi della statistica dell'energia e non l'unico scopo.

Tale criterio è stato messo in pratica nelle statistiche norvegesi fin dal 1911 (Cfr. *Statistique des forces motrices en* 1926, in Francia pag. 199 e seguenti) (1).

* * *

Il primo scopo della statistica è di rilevare i dati relativi ai singoli motori e generatori *installati* in uno stabilimento.

Per i motori primari si rileva : *a*) il numero, la *potenza* (in CV o in kW) ; *b*) la natura delle energie naturali utilizzate (vento, acqua, combustibili, carburanti, ecc.) ; *c*) le diverse specie o categorie (motori a vapore — a stantuffo, turbine a vapore — motori idraulici — ruote, turbine idrauliche — motori a scoppio con carburanti : gassosi — a gas povero, di gazogeni, di alti forni, gas naturale, ecc. — o liquidi : benzina, petrolio, olî pesanti, nafta, alcool, ecc. ; *d*) la destinazione (per azionare direttamente il macchinario, per alimentare generatori elettrici, per automezzi di trasporto terrestri, marittimi, fluviali, aerei, funivie, ecc.) ; *e*) le branche d'industria o di attività economica nelle quali sono « installati » ; *f*) i motori in servizio normale e *in riserva*.

(1) Nei dati manca tuttavia l'indicazione della potenza destinata a scopi di illuminazione e alla trazione elettrica, di cui si tiene conto però a parte nelle sole statistiche delle centrali elettriche.

I dati così rilevati vanno classificati, diversamente combinandoli, anche in relazione al numero degli esercizi presso cui sono installati, alla mano d'opera, ecc. e non trascurando, se possibile, anche la classificazione dei motori primari secondo *classi* di potenza (in CV o in kW) per ciascun tipo di motore.

Per i motori elettrici vanno rilevate le notizie di cui ai punti *a*), *e*), *f*), opportunamente combinandole e classificandole per classi di potenza. I motori elettrici « mobili » dei mezzi di trasporto elettrici vanno tenuti distinti dagli altri « fissi » ed entrambi vanno distinti in almeno due parti : a seconda che l'energia elettrica che li alimenta sia fornita dall'interno o dall'esterno.

Per i generatori si rilevano in genere la notizia di cui al punto *a*) *e*) *f*) ed anche la specie di motore primario con cui sono accoppiati (idraulici, a vapore, ecc.) e la potenza corrispondente all'energia elettrica venduta (o gli elementi sufficienti per calcolarla) (2).

§ 3. - La rilevazione statistica della « potenza » dei singoli motori e generatori. Potenza di targa, nominale, effettiva, fiscale, ecc. — In occasione di rilevazioni statistiche o di censimenti raramente vengono date al censito istruzioni particolari e precise circa il dato della potenza (in CV ; kW ; kVA) dei singoli motori o generatori, da indicare nel questionario di rilevazione. Ciò viene in genere giustificato con la ipotesi aprioristica che le persone tenute a compilare il questionario siano in grado di conoscere il dato della potenza. Senonchè

(2) La statistica dell'energia, per essere completa, dovrebbe essere affiancata da una buona *statistica annuale* :

1) della produzione di energia elettrica prodotta (in kWh) secondo :

a) la destinazione (illuminazione, privata e pubblica ; forza motrice ; trazione elettrica ; altri usi : per riscaldamento, elettrolisi, forni elettrici, ecc.) ;

b) le classi di attività economica, sufficientemente dettagliate, comprese le aziende artigiane e domestiche ;

c) energia prodotta da industrie elettriche vere e proprie e da autoproduttori.

In Italia queste statistiche hanno compiuto negli ultimi anni progressi notevoli grazie alle elaborazioni sempre più perfezionate fatte dall'UNFIEL. Altri progressi sono però da realizzare sopratutto in merito alla combinazione dei dati di cui al punto *a*) con quelli di cui al punto *b*) e ad una più razionale classificazione delle attività economiche in armonia alle classificazioni ufficiali.

2) della produzione, del commercio (estero e interno), dei « motori », generatori, e dei « mezzi di trasporto ». Per questa parte le statistiche italiane sono molto incomplete e tecnicamente ancora imperfette e arretrate.

3) della produzione, commercio, e, soprattuto, dei consumi, di combustibili e carburanti per rami di attività economica.

Statistiche del genere potrebbero gettare una luce notevole sugli sviluppi industriali del nostro paese, per singole branche di attività economiche e per ripartizioni territoriali. Uno stato corporativo non potrebbe, anzi, farne a meno per la redazione di piani economici, in pace o in guerra.

questa comoda presunzione in molti casi non corrisponde alla realtà perchè, da una parte, la persona cui è affidata la compilazione del questionario, più spesso, non è un tecnico e, dall'altra, perchè anche il tecnico può trovarsi imbarazzato a rispondere in modo corretto in quanto per ogni tipo di motore (specialmente per i motori primari) esistono diverse specie di potenza — con valori sensibilmente diversi — cui è possibile riferirsi. (Cfr. nota (2) a pag. 12*). Vi è quindi il pericolo di ottenere dai censiti risposte non omogenee e non comparabili.

Per le rilevazioni statistiche l'ideale sarebbe che per ogni motore primario, generatore e motore elettrico si verificassero due condizioni: *a*) che su di essi venisse sempre applicata dai costruttori — come si fa da tempo ad es. per i generatori e per i motori elettrici — una « targa » sulla quale, fra l'altro, figurasse il dato della potenza; *b*) che per l'indicazione della potenza figurante sulla targa fossero seguiti dai costruttori gli stessi criteri in modo da poter disporre di dati omogenei e sommabili. Nè l'una, nè l'altra condizione trovano, invece, completo riscontro nella realtà, per ciò che concerne i motori primari (accoppiati o non a generatori elettrici).

Norme *non* obbligatorie, di cui talune recenti, sono state in realtà emanate in diversi Paesi e anche in Italia (1) ma da inchieste appositamente eseguite (2), risulta che esse per i motori primari, nè sono sempre seguite dai costruttori, nè questi seguono norme uniformi. D'altronde in occasione di un censimento si debbono rilevare anche le notizie sulla potenza di motori o generatori costruiti molto tempo addietro quando, cioè, tali norme non esistevano. (Cfr. nota (1) a pag. 11*).

La mancanza di norme, istruzioni e direttive precise per le rilevazioni statistiche lascia aperta in molti casi la via ad indicazioni errate e sensibilmente discordanti. Ciò si verifica specialmente per alcuni tipi di motori (3). E la constatazione non è nuova (4).

---

(2) Presso il Prof. Ing. PERICLE FERRETTI, dell'Istituto Nazionale dei motori e presso diverse ditte costruttrici che cortesemente risposero con precisione alle domande rivolte. Si ricordano, in modo particolare, le ditte: Loro e Parisini; Costruzioni meccaniche Riva; FIAT; Ansaldo; Marelli; MAIN; Franco Tosi; Tecnomasio Italiano Brown Boveri; Ing. Moncalvi; Cantieri Navali e Officine Meccaniche di Venezia; San Giorgio; Pignone; Officine Ingegner Oreglia ecc.

(3) Per il più vecchio tipo di motore primario, costituito dalle *ruote idrauliche*, (per disopra, per disotto, di fianco, ritrecine) — che non portano targhe — non vi è la possibilità materiale di stabilire la loro potenza effettiva se non riferendosi alle caratteristiche del salto d'acqua od ai rendimenti della ruota. Per queste conviene perciò limitarsi a chiedere al censito il dato dei CV quale risulta sempre dal decreto di concessione del Ministero dei Lavori Pubblici anche quando si tratta di piccoli salti. Per questo tipo di motore primario gli errori che possono derivare in conseguenza della mancanza di una norma cui attenersi per l'indicazione della potenza possono considerarsi trascurabili per il complesso del Regno, ma abbastanza sensibili quando sono riferiti a particolari rami di industrie (in genere piccole industrie o aziende artigiane) nei quali è tuttora diffuso questo antiquato, ma comodo, mezzo di sfruttamento dell'energia meccanica dei piccoli salti di acqua (molini, spremitura olive, ecc.). Nel 1927 si censirono in Italia 22.936 ruote idrauliche che complessivamente avevano una potenza dichiarata di CV 116.681. Non è stato sempre possibile (come nel 1911: cfr. Relazione cens. 1911, Vol. V, pag. 88) ottenere dal censito distinzioni corrette fra ruote e turbine, cosicchè i dati pubblicati nei volumi riunirono i dati delle ruote e delle turbine.

Per i *motori a vento* (pochissimi però in Italia: nel 1927: 395 con CV 1551; nel 1911, 93, per CV 346) le difficoltà di dare istruzioni al censito, sarebbero ancora maggiori.

L'Ing. PERICLE FERRETTI, direttore dell'Istituto Nazionale dei motori, fece presente (comunicazione personale dell'11 maggio 1942) che, non esistendo generalmente targhe per le ruote idrauliche ed i motori a vento, occorrerebbe che il censito comunicasse i seguenti dati:

a) per le *ruote idrauliche* i valori della portata Q (in mc/sec) disponibile e di h dislivello (in metri) utilizzato. Supposto un rendimento della ruota di 0,75 la potenza in CV sarà $\frac{1000}{75} Q\, h\, 0{,}75 = 10\, Q\, h$.

b) per i *motori a vento*: i valori della superficie S delle pale in m²), il diametro medio D (in m.); il numero dei giri n. Supposto un rendimento medio del motore (corrispondente ad un vento medio) di 0,75 e il valore medio della forza tangenziale di 3 Cg/mq la potenza, sarebbe: $\frac{0{,}75 \cdot 3 \cdot S \cdot D \cdot n}{9.000} = \frac{2{,}5}{10.000} \cdot S \cdot D \cdot n$.

(4) Errori di rilevazioni si sono constatati anche per industrie tecnicamente molto progredite e cioè per le industrie di produzione energia elettrica, presso le quali annualmente il Ministero dei Lavori Pubblici - Servizio idrografico - rileva il dato della potenza installata del « gruppo » elettrico (e cioè motore idraulico accoppiato al generatore elettrico). Innanzi tutto è da notare che per queste rilevazioni si è rinunciato a rilevare la potenza *meccanica* del motore primario (turbina idraulica) in quanto questo è, nella quasi totalità, sprovvisto di targa. Si fa perciò riferimento alla potenza elettrica iscritta sulla targa dei generatori elettrici — che, per contro, esiste sempre o quasi — tuttavia si è osservato al riguardo (cfr. Relazioni annuali del 1920 in poi su « *La produzione di energia elettrica in Italia nel...* » Ministero dei Lavori Pubblici):

1) che il « valore normale di *targa* non è definito con criterio uniforme e non sempre è riferito ad una sicura base scientifica ».

2) che alcune volte i censiti hanno indicato il valore di targa; altre volte il « *massimo* carico che le macchine possono effettivamente sviluppare »; altre volte, infine, « il carico *medio* sviluppato in relazione alle disponibilità idriche della centrale ».

Inoltre osserva il MORTARA (« Nel cinquantenario della società Edison, 1884-1934; *Lo sviluppo dell'industria elettrica in Italia*. Appendice *A*: *Chiarimenti su dati intesi a misurare la potenza degli impianti elettrici e la produzione di energia*, pag. 309-318, a cura della Società Edison,

M. HUBER, nel 1932 (cfr. « Journal de la Société de Statistique de Paris », n. 11, nov. 1932, *La statistique des forces motrices en France en* 1926) osservava al riguardo : « la première question qui se pose est de définir nettement la puissance d'un moteur. Si la définition adoptée n'est pas toujours la même, la comparabilité des stâtistiques se trouvera compromise. Malheuresement, on a souvent le choix entre les définitions différentes et la même définition se traduit parfois par des régles empiriques variables.

A peu près tous les moteurs sont munis, par leurs constructeurs, d'une *plaque* d'identité mentionnant la *puissance nominale* qui correspond à certaines conditions normales de fonctionnement. Chaque constructeur définit aussi la puissance nominale d'après certaines régles *plus ou moins fixes*, qui peuvent être influencées par des conditions n'ayant rien à voir avec la technique, soit qu'il y ait une tendance à exagérer la puissance nominale en la portant à un taux qui ne pourrait pas être soutenu sans danger pendant une longue durée ; soit, au contraire, qu'on tende à la diminuer s'il existe un impôt gradué suivant la puissance. C'est ainsi qu'on voit apparaître une *puissance fiscale ou puissance taxée* sensiblement inférieur à la puissance effective Voir par exemple les catalogues d'automobiles) ».

A parte la questione della potenza fiscale — che raramente si presenta per i motori « fissi », di cui ora discorriamo e sulla quale torneremo — le osservazioni di M. Huber sembrano oggi eccessivamente pessimiste sia per le norme sempre più precise alle quali oggi il costruttore tende ad attenersi, sia perchè l'acquirente dei motori li collauda e li prova pretendendo giustamente che la potenza di targa, o la potenza altrimenti indicata dalla ditta costruttrice, risponda alla potenza *effettiva* sviluppabile dal motore. È da pensare anzi che il costruttore, per evitare contestazioni coll'acquirente, abbia la tendenza prudenziale ad indicare una potenza piuttosto leggermente inferiore che superiore a quella effettivamente sviluppabile dal motore. D'altronde ai fini di una rilevazione statistica di massa le differenze di indicazioni contenute entro limiti modesti — come è per la grande maggioranza dei casi — sono da considerare irrilevanti ai fini statistici non solo per effetto delle compensazioni aritmetiche fra differenze in più od in meno, ma anche perchè il dato sulla potenza utilizzabile che si ricerca è così grossolanamente approssimativo che le modeste differenze possono essere trascurate. Ciò porta a concludere che quando esista sul motore o generatore una « targa » la *potenza di targa o nominale* può essere senz'altro adottata per le rilevazioni statistiche, sia per ragioni di semplicità di rilevazione sia per i fini del calcolo che ci interessa.

La potenza di targa o nominale corrisponde infatti generalmente — con approssimazione sufficiente per i nostri calcoli — alla *potenza effettiva o normale* del motore intendendo per tale la potenza meccanica (o elettrica per i generatori) — determinabile con misure dinamometriche sull'albero o sull'asse del motore (o con misure elettriche per i generatori) — sviluppabile in modo continuativo (1) senza pericoli di danneggiamenti o usure anormali ed esclusi gli eventuali sovraccarichi (che un motore o generatore può sempre sopportare per un breve tempo e pari a circa 10-20%). È cioè la potenza su cui effettivamente si può contare sviluppata all'uscita (2) del motore o generatore. Senonchè, mentre targhe esistono quasi sempre con l'indicazione della potenza (effettiva) per i generatori elettrici e per i motori elettrici, per alcuni tipi di motori primari, invece, non esiste generalmente una targa contenente l'indicazione della potenza. Così in Italia essa non esiste quasi mai per le turbine idrauliche,

---

segue nota 4

Milano 1934) che « Sebbene normalmente non si impiantino motori primi per tenerli inoperosi o per utilizzarli solo in misura inadeguata alla loro capacità, per ragioni tecniche varie si trovano talora centrali con una potenza di motori primi che supera la potenza dei generatori in misura maggiore di quella richiesta dalle perdite » (pag. 314).

Il fatto di avere preferito di censire la potenza dei generatori elettrici (in ragione, sopratutto, dell'esistenza su questi di una targa) anzichè quella dei motori primi, introduce elementi di incertezza. Osserva ancora il MORTARA che nel determinare la potenza dei generatori « si incontra il solito fattore di incertezza inerenti alla determinazione della potenza di una macchina. Quando si voglia tradurre da chilovoltampère in chilowatt la potenza dei generatori di corrente alternata, e non sia specificato il valore di cos φ per il quale è costruita la macchina, si aggiunge un nuovo elemento di arbitrio » (pag. 315) e infine come accada che « talora la potenza dei generatori installati in una centrale sia superiore a quella dei motori primi » (pag. 315). (Si può, cioè, verificare anche il caso opposto a quello prima osservato).

Nel *censimento francese delle forze motrici del* 1931 si rilevò pure la potenza del generatore inscritta sulla targa e non quella del motore primario. (cfr. *Statistique des forces motrices en* 1931, Statistique générale de la France, Parigi, 1936, pag. 13).

---

(1) Si intende nelle condizioni di funzionamento previsto per i particolari tipi di motore : potere calorifico del carburante, pressione del vapore, numero dei giri, temperatura, ecc. Per i motori dei trattori la potenza effettiva anzichè come potenza al freno si usa indicare come « sforzo al gancio » di traino.

(2) La potenza effettiva del motore può misurarsi alla entrata e all'uscita del meccanismo motore propriamente detto. Così, ad es., in un motore a vapore, con stantuffo, può determinarsi sia come potenza allo stantuffo o pistone (entrata) o sull'albero del motore (all'uscita) : quest'ultima è inferiore alla prima per le perdite che avvengono nel passare dallo stantuffo all'albero. Così dicasi per le turbine a vapore (la potenza misurata sull'albero all'uscita è inferiore a quella all'entrata, all'imboccatura della turbina, sulle pale di questa, in funzione del salto termico), per le turbine idrauliche, per i generatori elettrici per i motori elettrici.

è poco estesa per i motori a vapore e manca talvolta anche per i motori a combustione interna, ma su questi l'indicazione della potenza non è sempre uniforme. Talvolta — generalmente nei motori di vecchia costruzione — esistono due indicazioni (ad es. CV 60/90): la cifra della potenza normale (o utile o più economica o contrattuale) seguita dalla cifra della potenza massima (che può differire dalla prima anche del 50% e più). Occorre, in questo caso, chiedere al censito di indicare la prima delle due potenze scritte sulla targa.

Per i «gruppi» termoelettrici può verificarsi che:

a) esistano due targhe: quella del motore termico primario e quella del generatore elettrico. È più frequente la presenza di due targhe quando, come accade più spesso in Italia, la ditta costruttrice del motore primario è diversa dalla ditta costruttrice del generatore;

b) esiste una sola targa: quella del generatore elettrico. Ciò accade specialmente quando la ditta fornitrice è, al tempo stesso, costruttrice dei motori primari e dei generatori (1).

In entrambi i casi potrebbe convenire di chiedere al censito la sola indicazione della potenza di targa applicata al generatore elettrico — che esiste sempre o quasi — ed attribuire questa anche al motore primario che lo aziona, senza con ciò commettere un errore apprezzabile, ai fini del calcolo della potenza (2) Si può, tutto al più, se del caso, aumentare d'ufficio di una certa percentuale la potenza *elettrica* del generatore per riportarla a quella *meccanica* del motore primario (3).

Occorre, in ogni caso, dare al censito una norma precisa.

La potenza dei generatori può essere indicata in kW (e quindi trasformabile in CV in base al coefficiente noto) per i generatori a corrente continua o

---

(1) Dalla *inchiesta* compiuta presso le maggiori case costruttrici italiane nel maggio 1942 la situazione nei riguardi delle targhe applicate ai motori e generatori può così riassumersi (il motore munito di targa *non* contenente l'indicazione della potenza — ma, ad es., il solo nome della ditta costruttrice e, o, il numero del motore, ecc. — è stato considerato come sprovvisto di targa):

Per le *turbine idrauliche*: una sola delle diverse ditte costruttrici interpellate — malgrado le norme dell'A. E. I. del 1° ottobre 1939: cfr. nota (1) a pag. 9* — applica una targa contenente l'indicazione di potenza, ma soltanto a partire dal 1940. Sulla targa figura talvolta una sola indicazione di potenza meccanica «utile contrattuale» in kW, talvolta la potenza meccanica «utile» *media* in kW, e talvolta due indicazioni di potenza corrispondenti ai due salti estremi, quando la turbina idraulica deve funzionare sotto cadute diverse.

Per i *motori a vapore*, pei quali le norme dell'A. E. I. non prevedono l'applicazione di targhe: cfr. nota (1) a pag. 9*, la situazione varia come segue:

a) alcune ditte costruttrici non applicano targhe contenenti l'indicazione di potenza (nè ai motori non accoppiati, nè a quelli accoppiati a generatori);

b) alcune ditte non applicano la targa ai motori accoppiati, ma la applicano a motori non accoppiati.

c) una ditta applica, per contro, la targa soltanto ai motori accoppiati ai generatori soltanto a partire dal 1940 e sulla targa figurano due potenze (elettriche) in kW, la normale e la massima.

d) la maggior parte delle ditte costruttici, applica (ed ha applicato anche in passato) una targa contenente la indicazione della potenza. Epperò vi possono essere indicazioni differenti a seconda che il motore non sia o sia accoppiato al generatore. Per i motori a vapore *non accoppiati a generatori*, dette ditte indicano sulla targa la potenza meccanica effettiva (o normale), espressa in CV. Per i motori a vapore *accoppiati a generatori* si possono distinguere i seguenti casi:

1) alcune di dette ditte indicano — come per i motori non accoppiati — la potenza meccanica normale o effettiva, espressa in CV, epperò qualcuna di dette ditte indica sulla stessa targa due potenze: la cifra della potenza meccanica «più economica» seguita da quella «massima» (o «massima continua»).

2) altre ditte indicano la potenza elettrica normale

segue nota 1

del generatore accoppiato esprimendola in kW (esistono quindi, pel «gruppo» due targhe, una del motore primario ed una del generatore, entrambe indicanti la stessa potenza in kW).

Per i motori *a combustione interna* — per i quali le norme del Comitato termotecnico italiano non prevedono l'applicazione di una targa: cfr. nota (1) a pag. 9* — si è accertato quanto segue:

1) alcune ditte non applicano targhe contenenti l'indicazione di potenza;

2) altre ditte la applicano — da tempo — soltanto se i motori *non* sono accoppiati a generatori;

3) altre ditte (alcune a partire dal 1930-1935, altre anche in anni più lontani) applicano targhe — tanto per i motori primari accoppiati che non accoppiati a generatori — con l'indicazione della potenza meccanica effettiva (o utile o normale) in CV. Alcune di queste ditte per i motori costruiti dopo il 1935-1937 — accoppiati o non — indicano sulla targa una sola cifra di potenza meccanica in CV, mentre precedentemente vi facevano figurare due potenze (in CV): la cifra della potenza effettiva (o utile o normale) seguita da quella della potenza «massima».

Ai *generatori* elettrici è generalmente applicata una targa sulla quale — in conformità dalle norme dell'A. E. I. — figura la potenza *elettrica* effettiva (o normale) in kW o in kVA (in questo ultimo caso figura anche il valore di cos φ).

Anche ai *motori elettrici* è generalmente applicata una targa con l'indicazione della potenza *meccanica* effettiva (o normale) in CV o — come prescrivono le norme dell'A. E. I. — in kW. Talvolta, per i motori di vecchia costruzione, l'indicazione dei CV è seguita da quella dei kW equivalenti.

Si è notato che in passato era frequente l'uso di indicare la potenza meccanica con il simbolo «HP» o «H. P.»; e che attualmente si leggono sulla targa diversi simboli o abbreviazioni di «cavallo vapore», ad es.: «CAV»; «CV»; «C. V.». Per i chilowatt si scrive «kW» o anche «KW».

(2) Per evitare imprecisioni si dovrebbero chiedere, nel questionario di censimento, indicazioni (numero e potenza) sui generatori elettrici distintamente a seconda della specie di motore primario che li aziona (come è stato, ad es., fatto in Inghilterra pel censimento del 1930: non sono a nostra conoscenza altri esempi). (Cfr. *Allegato*).

(3) In Inghilterra, ad es., nel 1930 — ai soli fini del calcolo della potenza installata — si è aumentata, d'ufficio, la potenza dei generatori del 10% per calcolare quella complessiva dei motori primari che li azionano, salvo il caso di turbine a vapore dato che queste «sono generalmente accoppiate direttamente ai generatori e la perdita di trasmissione è trascurabile» (cfr. *Final Report of the Fourth Census of Production of The United Kingdom* (1930), Parte V *General Report*, pag. 120. London, 1935).

in kVA per i generatori a corrente alternata. Per questi la trasformazione dei kVA in kW (e quindi in CV) presenta un certo margine di arbitrio, come si è già rilevato (cfr. nota (4) a pag. 9*) ma per i fini statistici, come si è detto (cfr. nota (1) pag. 6*), l'uso di un coefficiente medio di 0,8 sebbene approssimato (1), non arreca apprezzabili perturbazioni ai nostri calcoli.

Va ancora notato che per i « gruppi » elettrogeni non va rilevata la potenza di motori delle « eccitatrici » (che di norma possiedono una targa con l'indicazione della potenza) malgrado che queste assorbano oltre il 5% della potenza. In occasione di rilevazioni statistiche è perciò necessario dare istruzioni precise anche a questo riguardo per evitare errori.

Non viene generalmente mai rilevata la potenza dei gruppi « motore elettrico-generatore elettrico » (ad es. un motore elettrico asincrono a corrente alternata accoppiato a un generatore a corrente continua), delle commutatrici, trasformatori, ecc. poichè esse in definitiva trasformano soltanto energia elettrica con determinate caratteristiche in altra energia elettrica con caratteristiche diverse.

Tutti questi casi debbono formare oggetto di istruzioni ai censiti in occasione di rilevazioni statistiche. La complessità della materia spiega in parte la ragione prudenziale della norma generica impartita in Italia per i censimenti industriali del 1937-40 — nei censimenti precedenti non venne data alcuna norma — di indicare per i motori primari « la potenza *normale* » quale « risulta dalle caratteristiche tecniche dei singoli motori, indicate dalla ditta costruttrice o altrimenti accertate ». Ma una norma così generica — sebbene corretta — non può non dare luogo a rilevazioni inesatte. Le difficoltà di prevedere tutti i casi possibili (2) non debbono portare alla formulazione di norme troppo vaghe e indeterminate che originano sempre errori notevoli di rilevazione.

Pur tenendo presente che essendo i censimenti estesi a stabilimenti e esercizi di ogni natura (anche minuscoli e artigiani) occorrono norme semplici (compatibilmente con la natura del dato da rilevare) e comprensibili — il censito infatti deve già ricorrere ai libri contabili per rispondere ai molti quesiti posti in occasione di un censimento industriale e non può essere costretto a un lavoro eccessivo di interpretazione o di ricerca nei documenti di ufficio — non si deve rinunciare a un minimo di precisazioni (3). (Cfr. *Allegato*).

---

(1) In realtà si potrebbe chiedere al censito di indicare anche il valore del cos φ, sempre indicato sulla targa, ma ciò oltre a complicare la rilevazione non è sempre esatto in quanto il coefficiente di rendimento « può essersi abbassato in conseguenza dell'invecchiamento della macchina stessa e in qualche caso può essere superato quello inizialmente previsto a causa di trasformazioni fatte » (cfr. MINISTERO LL. PP. - SERVIZIO IDROGRAFICO, *Grandi utilizzazioni idrauliche per forza motrice*. Vol. XVI, Situazione al 31 dicembre 1940-XX, pag. 8).

(2) In realtà esistono per i motori « fissi » diversi concetti di potenza sui quali è possibile — in assenza di norme obbligatorie e tassative — che, entro certi limiti, possano giocare alcuni costruttori. Le ditte costruttrici di motori e loro parti calcolano la cosidetta potenza « *indicata* » — superiore alla potenza normale o effettiva — alla quale debbono proporzionare, nella costruzione, le diverse parti ed organi al motore. Per il calcolo di detta potenza esistono apposite norme di ordine teorico-costruttivo che non interessano nè le rilevazioni statistiche, nè gli acquirenti.

Per le *turbine idrauliche* (accoppiate a generatori elettrici) esiste una potenza *assorbita*, una potenza *utile*, una potenza *utile contrattuale* : (cfr. Norme dell'Associazione elettrotecnica italiana 4-1 edizione 1939 : queste dispongono l'uso della targa e l'indicazione su questa della potenza utile contrattuale. Tale norma non è però, ancora seguita da tutti i costruttori). Per le turbine idrauliche esiste anche una *potenza minima* o costante corrispondente al livello più basso delle acque che le alimentano, una potenza *massima* ed una potenza *media*, sempre in relazione alle naturali variazioni della portata d'acqua. Per le *turbine a vapore d'acqua* a condensazione esiste una potenza *normale*, ed una potenza *più economica*. Le norme esistenti (del 1938) non stabiliscono l'uso della targa.

Per i motori a *combustione interna* le norme del Comitato termotecnico italiano (edizione 1938) prevedono oltre che la potenza *indicata* (quella sviluppata dal fluido motore entro il cilindro), una potenza *effettiva* ; una potenza *utile* ; una potenza *continua* o *massima* ; una potenza di « *sovraccarico* ». Non sono però stabilite norme circa l'applicazione della targa.

Per i *generatori e motori elettrici* vi è una potenza *nominale* (o *di targa*, o *effettiva*, o *normale*) indicante la potenza che la macchina elettrica è destinata a sviluppare e che si può quindi normalmente richiedere nelle determinate condizioni di temperatura, giri, ecc.

Per i « gruppi » elettrogeni si può inoltre fare riferimento sia alla potenza « *meccanica* » del motore primario (misurata sull'albero o asse di questo) sia alla potenza *elettrica* (misurata ai morsetti del generatore).

(3) Vale la pena di ricordare come alcuni altri Paesi si sono regolati al riguardo.

In *Germania*, ad es., (negli ultimi censimenti del 1933) nel questionario di censimento il censito doveva indicare in apposita tabellina (per tutti i motori primari o elettrici e per i generatori) la potenza « nominale » (*Nennleistung*) in CV per tutti i tipi di motori primari e in kW per i generatori elettrici. Per i motori elettrici — e solo per questi — viene richiesto nel questionario stesso di indicare la potenza in kW « soltanto nel caso in cui i dati non possono essere forniti in CV (*vedere targa di potenza*) ». L'indicazione fra parentesi lascia intendere che la potenza « nominale » coincide con la potenza di « targa ».

In *Svizzera* (censimento 1937) soltanto per i motori elettrici è usata la denominazione di potenza « nominale » ed una avvertenza apposita indica che per potenza nominale dei motori elettrici si intende la « potenza indicata sulla targa » (*plaquette de firme*). Per i motori primari si chiese (per ciascun tipo di motore : idraulico, a vapore, ecc.) d'indicare la « forza motrice installata » (denominata anche nello stesso quesito come « energia totale *prodotta* dall'impresa ») intesa come la « potenza totale *massima* che può essere *prodotta* dalle installazioni generatrici di forza motrice esistenti presso l'impresa stessa ».

Nel *Regno Unito* (censimento 1930) si chiedeva al censito, nel questionario di censimento, d'indicare, per i motori primari, la potenza « *effettiva* » in CV che essi potevano sviluppare. Per i generatori ed i motori elettrici si chiedeva la potenza indicata o nominale (*rated capacity*) senza dare particolari definizioni sul significato di tale termine. Nel vocabolario Tecnico Illustrato di A. SCHLOMANN (Vol. II :

* * *

Una menzione particolare merita anche la questione della cosidetta « potenza *fiscale* » (o potenza *tassata*), che appare quando in uno Stato esistono imposte graduate sulla potenza del motore. In questi casi o sulle targhe direttamente o sui documenti che seguono il motore appare l'indicazione della *potenza fiscale*. In Italia non si verifica il caso per i motori « fissi », che non sono soggetti a tassazione, ma esiste per i motori « mobili » degli automezzi di trasporto non elettrici.

In Norvegia, invece, ad es., esiste (od esisteva) una potenza fiscale anche per i motori « fissi » denominata nelle rilevazioni e pubblicazioni statistiche come potenza « nominale ». Per passare da questa potenza a quella effettiva (le statistiche norvegesi pubblicano i dati della potenza espressa, correttamente, in cavalli « effettivi ») si deve moltiplicare la prima per il coefficiente 2,5 : si ha un esempio delle sensibili differenze che possono determinarsi nelle cifre statistiche a seconda che si segua l'una o l'altra delle potenze (1).

È peraltro evidente, per i confronti nel tempo e per quelli internazionali, la necessità di riferire tutti i dati ad un unico tipo di potenza e preferibilmente al dato della potenza effettiva. Quando ciò non si verifichi si dovranno indicare sempre i coefficienti da applicare per una eventuale trasformazione in potenza effettiva.

Per quanto concerne la potenza dei motori primari « mobili » (dei mezzi di trasporto terrestri o per via d'acqua) non viene in Italia applicata una targa contenente l'indicazione della potenza.

Per i motori terrestri esiste però un'altra fonte di rilevazione statistica costituita dal *libretto di circolazione* che deve sempre accompagnare il mezzo di trasporto, sul quale figura la *potenza fiscale*.

Questa potenza — determinata con formule apposite previste dalle disposizioni legislative — non è però in rapporto costante con la potenza effettiva. Il rapporto varia da motore a motore per ragioni tecnico-fiscali a seconda il tipo, la destinazione, ecc. (2)

Nei censimenti industriali effettuati in Italia — che si estendono anche ai mezzi di trasporto — non si è data al censito alcuna particolare istruzione supponendo che il censito indichi il dato più facilmente a sua portata di mano, cioè quello iscritto nel libretto di circolazione. Le potenze fiscali vengono trasformate in « effettive » moltiplicandole per un coefficiente medio approssimativo di 2,5 per le automobili e di 1,5 per gli autocarri.

Per i motori « mobili » delle navi, solo un'esigua parte dei motori navali (circa il 10%) di vecchia costruzione porta in Italia targhe con la indicazione di potenza. Per gli altri motori la indicazione si trova negli atti di bordo ed è comunque indicata per ciascuna nave nel Registro Navale. In questo o negli atti di bordo, o sulle vecchie targhe, figura la potenza « indicata » o cavalli indicati (CI) (3) o la potenza effettiva (*CV-asse* o *cavalli-asse* (CA). I cavalli-asse corrispondono in media a 0,80 cavalli-indicati (il coefficiente varia in realtà da motore a motore, da 0,70 a 0,90 circa).

Nel questionario di censimento dei trasporti marittimi del 1938, si è chiesto esplicitamente al censito, per l'apparato motore delle navi, l'indicazione in « cavalli-vapore indicati » per i motori a vapore ad esclusione delle turbine a vapore, per i quali, come per i motori a combustione interna, vennero richiesti i « cavalli-vapore-asse ».

§ 4. - Potenza « installata » - Potenza « teoricamente utilizzabile » - Potenza « praticamente utilizzabile » - « Potenza utilizzata ». — A) *Potenza installata.* — Uno degli scopi della rilevazione della potenza dei singoli motori e generatori, — considerati

---

segue nota 3
Elettrotecnica ed elettrochimica - Tecnische Worterbücher. Verlag, G. m. b. H. Berlin, 1928. Ed. Sperling & Kupfer) alla voce « rated capacity » si legge la seguente definizione « capacità indicata in un listino di prezzi correnti ». Probabilmente si tratta anche qui di potenza di targa, come, del resto, per i motori primari in quanto non vi dovrebbe essere differenza sensibile fra potenza « effettiva » e potenza « di targa » (vedi sopra nel testo).

Negli Stati *Uniti d'America* (censimento 1929) si chiese, senza particolari definizioni, la potenza in CV dei motori primari e dei motori elettrici e quella in kW dei generatori. Dal contesto si presume si tratti di potenza di targa (« *rated horsepower* » o « *rated capacity* »).

(1) In Norvegia (cfr. *Statistique générale de la France : Statistique des forces motrices en* 1926, pag. 199 e volume 1931, pag. 216), sembra che il censito possa indicare per le diverse specie di motori fissi tre tipi di potenze : la potenza « indicata » (cfr. nota 2 pag. 12*) la potenza « nominale » (o fiscale) e la potenza effettiva. I CV « nominali », si moltiplicano per 2,5 onde trasformarli in effettivi. I CV « indicati » si dividono, invece, per 0,80 per ottenere i CV effettivi.

(2) Fatto eguale a 100 la potenza fiscale, quella effettiva varia da 140 a 150 circa per gli autocarri industriali più comuni soggetti a tassa ; da 200 a 300 per le autovetture più comuni (Ardita, 193 ; Balilla 200-246-300, rispettivamente per : tipo comune, 1100, Berlina sport ; tipo 1500 : 226 ; ecc.) fino a 500-600-800 per le macchine da corsa.

In *Francia* la potenza fiscale degli autoveicoli corrisponde, per lo più, a un terzo della potenza effettiva (cfr. LEPRINCE-RINGUET, *cit.*, pag. 100).

(3) Cfr. *Registro Italiano navale* (R. I. N. A.) Libro registro (1940-XVIII, Genova) nel quale per i piroscafi e motonavi figurano più di frequente i cavalli indicati (C I) oppure i cavalli-asse (C A) : questi figurano più spesso per altri tipi di nave, motovelieri, ecc. Nei piroscafi più antichi figurano anche i *cavalli nominali* (CN) : in questo caso la parola « nominale » ha un significato diverso da quello correntemente usato per i motori fissi come sinonimo di potenza di targa. Si tratta qui, invece, di una indicazione di valore *commerciale*, ora scarsamente in uso, variabile da costruttore a costruttore che è uguale, in media circa 1/5-1/6 della potenza « indicata ».

a sè stanti è quello di determinare la potenza (meccanica o elettrica) delle unità statistiche « stabilimenti » o « esercizi » (industriali o non, fino all'azienda domestica).

La « potenza » dello stabilimento o dell'esercizio costituisce uno dei tanti elementi caratteristici (come, ad es.: numero di addetti, ore di lavoro, quantità o valore della produzione, ecc.) presi in considerazione dalle statistiche che hanno come oggetto l'unità statistica « stabilimento » o « esercizio ».

La rilevazione della potenza delle singole unità produttrici di energia (motori e generatori) va sempre riferita, quindi, allo stabilimento o esercizio (industriale o non, compresa la azienda domestica) presso il quale dette unità sono « installate » e, successivamente, al ramo di attività economica, alla provincia, allo Stato. Si avrà quindi per ciascuno stabilimento, ad es., l'indicazione, fra l'altro, del numero dei motori primari « installati » e della loro potenza (nominale o effettiva), il numero e potenza dei generatori « installati » il numero e potenza dei motori elettrici « installati ». Per passare dal singolo stabilimento o esercizio al ramo di attività, oppure alla provincia o allo Stato, non v'è che fare la somma delle potenze relative alle unità statistiche comprese nel ramo di attività, provincia, Stato. Avremo quindi, per ciascun ramo e per ciascuna circoscrizione territoriale considerati, tre cifre *distinte :* una cifra complessiva della potenza dei motori primari «installati» o potenza primaria *installata*; un'altra cifra relativa alla potenza dei generatori *installati* e infine una terza cifra della potenza dei motori elettrici installati o potenza secondaria *installata*.

Poichè la potenza è esprimibile — sia essa primaria o secondaria, meccanica o elettrica — nella stessa unità di misura (ad es. kW) può essere istintivo il desiderio di non limitarsi a considerare *distintamente* le tre cifre della potenza «installata» ma di avere un dato unico (in kW) complessivo per lo stabilimento (ramo d'industria, ecc.) così come quando, ad es., dalle singole categorie di personale, distintamente considerate, si desidera passare al numero degli addetti complessivamente occupati nello stabilimento (ramo d'industria, ecc.) ; o come quando, ad es., dal valore delle singole merci prodotte (o delle singole materie prime impiegate) si vuole passare al valore complessivo della produzione (o delle materie prime impiegate).

Senonchè nel caso della potenza non è possibile fare una semplice somma delle tre specie di potenze installate perchè in molti casi la somma dei dati stessi non avrebbe senso : la potenza secondaria « installata », infatti, può non essere altro che l'equivalente dell'identica potenza « primaria » installata. Pur avendo ad es. una potenza « installata » di 50 kW del motore primario, una potenza « installata » di 50 kW del generatore ad esso accoppiato ed una potenza secondaria « installata » di 50 kW dei motori elettrici (azionati dal generatore stesso), lo stabilimento non potrà *utilizzare* che 50 kW (e non 150 e nemmeno 100) (1).

Il fatto che le tre potenze installate siano espresse nella stessa unità di misura (kW), non è motivo sufficiente per sommarle, così come non si sommerebbero mai, ad es., i dati rilevati in un censimento per il solo fatto che sono espressi nella stessa unità monetaria « lire » o « quintali ». Non si sommerebbe cioè, il valore delle materie prime con il valore della produzione, o questo con il valore dei salari, o dell'energia consumata. Così, ancora, ad es., per determinare le quantità prodotte da uno stabilimento industriale si avrà cura di eliminare i « reimpieghi » cioè i prodotti intermedi successivamente reimpiegati per ottenere il prodotto finito (2).

Gli è che, non interessa tanto il dato della materiale potenza « installata » quanto quello della potenza « *utilizzabile* » in complesso dallo stabilimento per raggiungere il fine che gli è proprio : quello della produzione industriale.

I tre organi (primari e secondari) — produttori o sviluppatori di energia — « installati » e « a disposizione » dello stabilimento sono *strumenti* per produrre energia (primaria o secondaria) ; non è la capacità singola di ciascuno a produrla che interessa, ma la « capacità » che è *utilizzabile* dallo stabilimento o esercizio in un dato momento.

Quando non esisteva nè il motore elettrico nè il trasporto a distanza dell'energia elettrica — e quindi nemmeno vendite ed acquisti di energia — la po-

---

(1) L. March (*cit.*) osservava fin dal 1911 : « . . . les moteurs primaires (qui) empruntent leur énergie à un agent naturel ». « . . .Au contraire le *moteur secondaire* ne fait que réstituer l'energie mécanique fournie par un moteur primaire et transmise par un agent intermédiaire : c'est le cas des moteurs electriques, des moteurs à air comprimé ou raréfié ».

Il y a. . . *double emploi* quand on ajoute la puissance des moteurs secondaires à celle des moteurs primaires qui les alimentent indirectement ; par esemple quand on ajoute à la puissance des moteurs à vapeurs ou hydraulique d'une station centrale électrique, celles des moteurs électriques desservis ». . . « Il importe que l'on sépare nettement les moteurs primaires qui transforment un source quelconque d'energie (autre que de l'énergie mécanique ou cinétiques) et les moteurs secondaires qui n'ont en somme pour fonction que de transporter d'un point à un autre une certaine quantité d'énergie mécanique (moteurs électriques, moteurs à air comprimé, etc.)».

(2) Se per produrre un quintale di tessuto di cotone, partendo da cotone in bioccoli produco prima i filati (prodotto intermedio) e poi reimpiego questo nello stesso stabilimento per produrre il tessuto, non sommerò la quantità di cotone (materia prima) con quella del filato (reimpiegato) e con quella del tessuto (prodotto finito).

tenza globale « utilizzabile » coincideva con la potenza *primaria* « installata »: tanto nel singolo stabilimento quanto nello Stato. Non solo vi era coincidenza tra potenza « installata » e potenza « utilizzabile » ma esisteva anche un unico scopo: l'azionamento del macchinario. È ciò che si può verificare anche oggi, quando lo stabilimento è produttore e unico consumatore dell'energia elettrica prodotta. Solo che, in questo caso, occorre usare l'accorgimento di non sommare i dati della potenza primaria con quelli della potenza secondaria (occorre prendere cioè o l'uno o l'altro dei dati). Peraltro l'utilizzazione dell'energia può non essere unica, ma duplice: energia elettrica per azionare il macchinario e, altresì, per impieghi diretti (termici, illuminazione, ecc.).

Uno stabilimento con due motori primari di 50 kW ciascuno azionanti due generatori di pari potenza e questi a loro volta motori elettrici aventi una potenza complessiva di 100 kW, avrà una potenza « utilizzabile » di 100 kW allo scopo di azionare il macchinario. Se però l'energia elettrica di uno dei generatori di 50 kW viene impiegata per usi diretti (forni elettrici) la potenza globalmente utilizzabile (o « installata ») per qualsiasi scopo, sarà sempre di 100 kW, ma quella « utilizzabile » (e « installata ») soltanto per azionare il macchinario sarà di soli 50 kW.

Per l'intero Stato (supposto che non vi sia commercio estero di energia elettrica) per *tutti* i possibili rami di attività e considerando *tutti* gli usi possibili di energia (scopo terzo) si può anche oggi parlare indifferentemente di potenza *primaria* « installata » (di motori fissi e mobili) e di potenza « utilizzabile » in quanto a questa deve sempre fare riscontro la potenza globale dei motori *primari* installati che costituiscono l'unica fonte di energia utilizzabile, tutte le altre potenze non essendo che potenze *derivate*.

La potenza « utilizzabile » per il solo scopo di azionare il macchinario, *sia nel singolo stabilimento che nello Stato*, può essere sempre considerata come una quota parte della potenza « installata » in quanto il macchinario stesso non può essere azionato, come abbiamo detto più volte (cfr. paragr. 2), che da motori primari azionanti direttamente il macchinario « installato », nello stabilimento o da motori elettrici (azionati dall'interno e, o, dall'esterno) pure « installati » nello stabilimento (1).

(1) Se chiamo Pm la potenza dei motori *primari* installati che azionano il macchinario ed E la potenza di tutti i motori elettrici, gli uni e gli altri azionanti sul posto il macchinario, si può usare per lo scopo indicato la formula generale (valida tanto per lo stabilimento, quanto per il ramo d'industria o di attività, provincia, Stato): $Pm + E$ nella quale potenza « installata » e « utilizzabile » si equivalgono.

Ma allorchè si debbono considerare i dati dei singoli rami di attività e circoscrizioni territoriali minori, il trasporto dell'energia a distanza — *che implica acquisti e vendite di energia elettrica* — e tutte le molteplici possibili utilizzazioni dell'energia prodotta, sul posto e a distanza, dal motore primario installato (cfr. paragr. 1, pag. 4* e seg.), vi è divergenza fra il concetto di potenza, materialmente, « installata » — concetto che risale ai primi tempi dell'uso di forza motrice — e quello di potenza « utilizzabile ».

Continuare a parlare di calcolo di potenza globalmente « installata » con fine a sè stesso, costituisce un non senso e porterebbe, come ha infatti portato (cfr. paragr. 17), a equivoci, confusioni ed errori.

Il calcolo della potenza « installata » riferito cioè a motori e generatori materialmente installati, fissi al suolo, e alla loro capacità di produzione — considerata in sè stessa — dovrebbe fare astrazione, fra l'altro, dalle vendite in quanto queste avvengono senza modificare la potenza « installata ».

È quindi opportuno sostituire definitivamente al concetto e al calcolo della potenza « installata » (2) quello di potenza « utilizzabile ».

B) *Potenza «teoricamente» utilizzabile.* — Conviene quindi passare dal concetto di potenza « installata » a quello di potenza « utilizzabile ».

A questo riguardo occorre richiamare preliminarmente quattro premesse fondamentali:

1) In primo luogo, come si è detto al § 1, pag. 3*, il calcolo che ci interessa intende riferirsi ad una « capacità » (di produzione o di consumo di energia), a una possibilità cioè e non a una produzione effettiva o a un consumo effettivo. Il dato che si vuole ottenere deve quindi essere espresso in unità di potenza e cioè in kW (o CV) e non in chilowattore (kWh). I due concetti vanno sempre tenuti ben distinti perchè la loro confusione è causa di equivoci e di errori. La statistica dei consumi effettivi di energia — malgrado la sua importanza — deve essere considerata a parte.

2) In secondo luogo il calcolo deve sempre riferirsi ad uno *scopo ben determinato*: ad ogni scopo corrisponde una diversa cifra di potenza. Avremo quindi, in generale, due cifre corrispondenti ai due scopi principali: « azionare il macchinario » e « altri scopi ».

3) In terzo luogo va tenuto ben presente che passando dall'installazione alla « utilizzazione » si

(2) La parola « installata » dà inoltre l'idea di un impianto « fisso » e non si addice ai motori « mobili » degli automezzi che pure possono essere compresi nel calcolo della potenza (cfr.: Scopi terzo, quarto e quinto, § 5, pag. 20*).

viene a fare riferimento non più ad una *capacità di produzione* (dei motori o generatori installati) ma ad una *capacità di consumo* (utilizzazione teorica) o, quanto meno, ad una capacità di produzione messa a disposizione delle installazioni possibili consumatrici di energia (meccanica od elettrica) perchè sia da queste utilizzabile. Si sposta quindi il punto di riferimento (1).

4) In quarto luogo si prescinde — in conseguenza del primo concetto precedentemente indicato — dalla « durata » della possibile utilizzazione, cioè dal fattore « tempo » durante il quale può, evidentemente, variare la forma, il modo, lo scopo dell'utilizzazione. Come per la potenza installata, la capacità resta invariata sia che il motore resti inattivo o funzioni in continuazione. In pratica, ci si deve basare quindi sulla potenza utilizzabile in un determinato giorno (il giorno del censimento) supponendo che tale utilizzazione resti invariata nel corso del tempo. Se si volesse fare entrare in gioco il fattore « tempo », con possibili mutamenti anche negli scopi dell'utilizzazione, si passerebbe al concetto di consumo o utilizzazione *effettiva*.

A primo tratto la determinazione della potenza « utilizzabile » può sembrare facile nel senso che si può pensare di aggiungere alla potenza dei motori *primari* « installati » (a qualunque uso siano destinati) la *potenza corrispondente* all'energia elettrica acquistata e di togliere la potenza *corrispondente* all'energia venduta (a qualunque uso siano destinati gli acquisti o le vendite). Questo metodo di calcolo fu adottato in pratica per molti anni ad es. dalla Svizzera (che l'abbandonò solo col censimento del 1937). Senonchè tale procedimento non è nè concettualmente corretto, nè praticamente di facile attuazione. Dal punto di vista concettuale, infatti, si sommano elementi di natura eterogenea in quanto, da una parte la potenza primaria « installata » costituisce, in armonia ai concetti fondamentali su cui si basa il nostro calcolo, una *capacità teorica* — che si conteggia quindi tanto se il motore primario venga azionato in continuazione quanto se resti inoperoso per tutto l'anno o per una parte — mentre, dall'altra, gli acquisti o le vendite costituiscono consumi effettivi, variabili in funzione del tempo. Si tratta cioè di un concetto ibrido.

Si faccia l'ipotesi di uno stabilimento che abbia installato un « gruppo » costituito da un motore primario di 100 kW accoppiato a un generatore di pari potenza per produrre energia che viene destinata *tutta* ai bisogni interni dello stabilimento, il quale non acquisti nè venda energia. La potenza « utilizzabile » — capacità teorica — sarà di 100 kW anche se il motore « lavora », ad es. solo per sei mesi. Se lo stesso stabilimento vendesse invece a terzi l'energia prodotta per sei mesi figurerebbe, seguendo il metodo in questione, con una potenza di 50 kW (2), tanto se negli altri sei mesi continuasse a lavorare per i bisogni interni — come nel caso precedente nel quale si calcolava una potenza di 100 kW — quanto se non lavorasse affatto. È evidente l'incongruenza.

Vi è inoltre una difficoltà pratica, insormontabile perchè le vendite e gli acquisti si esprimono in kWh, cioè in termini di lavoro, e non in termini di potenza, cioè in kW. Il passaggio dai kWh ai kW (di potenza corrispondente) è irto di difficoltà (cfr. paragr. 1 pag. 4* e paragr. 9 pagg. 29* 30*) e richiederebbe in ogni modo la rilevazione di nuovi dati. Solo per le imprese di produzione e di elettricità che vendano *tutta* l'energia prodotta il passaggio potrebbe essere tollerabile per calcoli grossolanamente approssimativi, in base all'ipotesi che la potenza (in kW) corrispondente a tutta l'energia venduta equivalga, a tutta la potenza primaria (o dei generatori) installata (3).

Quando poi si voglia, come è necessario, riferire il dato della potenza « utilizzabile » e anzichè a tutti gli scopi possibili, a ciascuno dei diversi scopi indicati al paragr. 5, occorrerebbe scindere la quantità acquistata (o venduta) in tante parti secondo le destinazioni reali ed effettive dell'energia acquistata o venduta : si moltiplicherebbero cioè le difficoltà precedentemente indicate circa il passaggio — per ciascuno degli scopi suddetti — dai kWh ai kW. È necessario perciò procedere per altre vie (4).

Come si è già detto parlando di potenza « utilizzabile » si dovrebbe fare riferimento non più, o non soltanto, agli organi « installati » *produttori* di energia (primaria o secondaria, originaria o derivata o trasformata) — che possono produrre energia per venderla, diminuendone di altrettanto la disponibilità, o assorbire energia di acquisto — ma bensì alle installazioni finali « *consumatrici* » dell'energia, esistenti

(1) La capacità di consumo, così intesa, può essere anche superiore a quella di produzione, come nel caso di motori secondari dimensionati, installati, ad abbondanza.

(2) All' energia prodotta per sei mesi (cioè per metà anno) dovrebbe, infatti, fare riscontro la metà della potenza del motore primario : farebbe riscontro l' intera potenza (100 kW) se lavorasse tutto l' anno.

(3) In tal caso si supporrebbe che motori e generatori funzionino a pieno carico: ciò che in pratica non accade sempre.

(4) Comunque, il sistema avrebbe il vantaggio teorico di soddisfare alla condizione preliminare della « quadratura » dei dati poichè è evidente che, per l'intero Stato (escluso il commercio estero di energia) gli acquisti eguagliano le vendite e quindi la somma delle potenze calcolate per ciascun stabilimento corrisponde alla somma delle potenze dei motori *primari* installati nello Stato.

nello stabilimento per i fini che questo si propone. Dette installazioni, assorbitrici, consumatrici di energia, sono costituite non solo dai macchinari veri e propri, ma anche da impianti di forni elettrici, batterie d'elettrolisi, impianti di illuminazione, mezzi di trasporto motorizzati, ecc. È dalla potenza di queste installazioni possibili consumatrici — calcolata direttamente o indirettamente — che dipende la potenza che deve essere messa a disposizione, cioè la potenza «*disponibile*» — teoricamente disponibile — di ciascun stabilimento. Contro questa deve stare, *per l'intero Stato* una corrispondente capacità di produzione, cioè di potenza *primaria* unica fonte di energia «disponibile» nello Stato (escluso il commercio estero di energia) (Cfr. nota 2).

Non è necessario peraltro determinare direttamente la «potenza» di tali installazioni: è sufficiente calcolare la «potenza» (meccanica o elettrica, primaria o secondaria) che deve essere messa a *loro disposizione*.

Se si trattasse soltanto di determinare la potenza «utilizzabile» *al solo scopo di azionare il macchinario* il calcolo non presenterebbe difficoltà in quanto basterebbe sommare tre dati noti: *a*) la potenza dei motori primari azionanti direttamente il macchinario; *b*) la potenza di tutti i motori elettrici azionati dall'interno; *c*) la potenza dei motori elettrici azionati dall'esterno (la somma delle potenze *b* e *c* non è altro che la potenza di tutti i motori elettrici installati). Per questo scopo — e per *questo soltanto* — si avrebbe in tal modo un perfezionamento in confronto al metodo precedentemente indicato nel senso che si elimina il difetto concettuale e la difficoltà pratica di passare dai kWh ai kW. Infatti la potenza (in kW) *corrispondente* all'energia acquistata (in kWh) viene sostituita con il dato di cui al punto *c*), mentre la potenza installata di tutti i motori primari (in kW) meno la *potenza* (in kW) corrispondente all'energia venduta (in kWh) è eguale alla potenza di cui al punto *a*) più quella di cui al punto *b*).

Difficoltà si presentano invece quando si debbono eseguire i calcoli per gli altri scopi poichè, in tal caso, si deve determinare la potenza corrispondente alle installazioni consumatrici diverse dal macchinario e cioè la potenza a disposizione delle installazioni consumatrici *dirette* — senza il comodo intermediario del motore elettrico — di energia elettrica (prodotta all'interno o di acquisto).

Se dette installazioni possedessero, come i motori elettrici, una targa con l'indicazione della potenza — o la potenza fosse altrimenti e facilmente ricavabile da indicazioni analoghe (lettura amperometri, potenza dei convertitori di batterie elettrolitiche, trasformatori di forni elettrici ecc.) il problema si risolverebbe chiedendo, in occasione dei censimenti, accanto alla potenza dei motori elettrici, la potenza dei forni elettro-metallurgici, degli impianti di illuminazione, delle batterie elettrolitiche, dei forni elettrici per cottura del pane, per riscaldamento vapore, ecc. Si tratterebbe di una complicazione non lieve, ma non insuperabile (1).

Comunque, per ora, dati del genere non esistono in nessun Paese e dobbiamo limitarci a determinare *indirettamente* la potenza da mettere a disposizione di dette installazioni. Su ciò torneremo nel corso del presente studio (2).

Importante è di chiarire i concetti basilari e teorici ai quali può essere informato il calcolo della potenza utilizzabile, al quale si riferisce essenzialmente il presente lavoro. Per il calcolo di questa potenza (come del resto per quello eventuale della potenza «installata») si devono considerare anche i motori o generatori in riserva (3) in armonia al concetto di «capacità» teorica, astratta, di produzione.

C) *Potenza «praticamente» utilizzabile e potenza efficiente.* — Ad una determinata potenza teoricamente «utilizzabile» non corrisponde sempre e in ogni caso la stessa potenza praticamente «utilizzabile» in quanto vi possono essere delle circostanze di fatto che limitano la possibilità di un effettivo e totalitario sfruttamento della potenza «utilizzabile».

Facciamo alcuni esempi.

Se per un guasto un motore primario di 50 kW resta inutilizzato temporaneamente, la potenza «installata» e quella teoricamente utilizzabile, sono entrambi di 50 kW ma quella praticamente utilizzabile — in quel momento — è zero. Ma a prescindere da questo caso riferito a circostanze eccezionali e anormali può accadere che in uno stabilimento motori primari, generatori, e motori elettrici non possano essere azionati *tutti simultaneamente*. Così, ad es., con un motore primario di 50 kW che lavori in continuazione (accoppiato ad un generatore elettrico di potenza corrispondente) possono

(1) I forni elettrici di ogni genere portano sempre l'indicazione dei kW; per gli impianti di illuminazione ogni lampadina elettrica porta l'indicazione dei Watt (W) di potenza.

(2) Comunque dovrà essere assicurata la «quadratura» desiderata in quanto la somma delle potenze utilizzabili e consumabili di uno Stato, non può superare mai la potenza dei motori primari installati complessivamente nello Stato stesso, unica fonte «originaria» dell'energia disponibile. In realtà la somma delle potenze disponibili in ciascun stabilimento sarà sempre inferiore per le perdite di trasformazione e di trasporto dell'energia nel passare dal luogo di produzione, cioè dal motore primario, al luogo di consumo, all'installazione consumatrice.

(3) Cioè i motori primari, generatori o motori elettrici installati soltanto per essere messi in azione in caso di guasti, riparazioni ecc. degli altri motori normalmente funzionanti.

essere installati e disponibili due, tre, quattro motori elettrici di 50 kW ciascuno (*azionati dall'interno*) con una potenza complessiva, quindi, di 100, 150, 200 kW, poichè essi vengono di fatto azionati alternativamente (ad es. ogni giorno rispettivamente per 12, per 8, per 4 ore ciascuno) (1). La potenza praticamente « utilizzabile » per azionare il macchinario è soltanto quella primaria di 50 kW, quella teoricamente utilizzabile è rispettivamente di 100, 150, 200 kW.

Se un'abitazione dispone di 10 lampadine elettriche (tutte di pari potenza) ma in ragione di un contratto a *forfait* non se ne possono accendere *simultaneamente* più di 5, si avrà una potenza « teoricamente utilizzabile » pari a quella delle 10 lampadine installate e una potenza « praticamente utilizzabile » di metà.

Così ancora due motori primari *idraulici* di 50 kW possono funzionare contemporaneamente soltanto ad es. per un periodo di tre mesi, durante la massima disponibilità delle acque, mentre negli altri nove mesi può funzionare un solo motore, non essendovi sufficiente disponibilità di acqua per azionarli entrambi. La potenza *media* « utilizzabile » sarebbe di 3/12 di 100 kW (25 kW) più $\frac{50 \times 9}{12} = 37{,}5$ kW, totale 62,5.

Per le centrali idroelettriche si usa denominare potenza « efficiente » quella corrispondente a quella parte della potenza complessiva che si riferisce alla potenza dei motori primari (o generatori) che possono operare *simultaneamente* (cfr. G. MORTARA, cit. pag. 315) (2).

Anche per i motori primari a vapore può verificarsi che le caldaie installate siano insufficienti per alimentare *simultaneamente*, in continuazione, tutti i motori a vapore installati (a prescindere dai motori in riserva) per cui la potenza praticamente « utilizzabile », risulterebbe, anche in questo caso, inferiore a quella « teoricamente utilizzabile ».

Nei motori idraulici, sopra esemplificati, la energia naturale è, per così dire, separata dal motore che la utilizza per modo che l'energia potenziale del fluido (acqua) non è sempre sufficiente (oppure è anche esuberante) per permettere ai motori di sviluppare tutta la loro potenza effettiva. Invece, per i motori a vapore ed a combustione interna (a benzina, nafta, ecc.) la potenza teoricamente utilizzabile tende ad eguagliare la potenza « utilizzabile » (3).

Nel concetto di potenza « praticamente utilizzabile » può comunque inserirsi sia pure indirettamente — cioè come mezzo o strumento di calcolo — l'elemento tempo.

Si intacca cioè il concetto di capacità « teorica » per fare riferimento anche a possibilità « *pratiche* » di utilizzazione effettiva che possono variare nel corso del tempo.

D) *Potenza utilizzata*. — Si può, infine, riferire la potenza al consumo effettivo, in funzione cioè del tempo. Si parla allora di potenza « utilizzata » o « consumata ». Questa costituisce una frazione della potenza utilizzabile ed è in funzione del grado di sfruttamento *reale* della potenza disponibile e utilizzabile. Con una potenza disponibile di 100 si può avere una potenza utilizzabile di solo 50 ed una potenza utilizzata di 25 o anche di zero (in caso di inattività). La potenza « utilizzata », è sempre in funzione delle ore di « lavoro » delle forze motrici installate : non risponde più a una « capacità », ma ad un lavoro effettivo. Detta potenza va quindi, più logicamente, messa in relazione con la produzione *effettiva* dello stabilimento (nell'anno, ad es.) e non alla capacità di produzione (cfr. paragr. 1 pag. 3*). Entra in gioco quindi il concetto del tempo o di un ciclo di tempo (ad es. anno di censimento). Il dato male si esprime quindi in termini di potenza, cioè in CV o kW, meglio sarebbe esprimerlo in CV-ora o in kWh (per determinare i kWh corrispondenti ai kW di motori primari che azionano direttamente i macchinari, occorrerebbe conoscere le ore di « lavoro » o di azionamento). Va anche tenuto presente che lo stesso motore può funzionare con potenza inferiore all'effettiva (e si ha una perdita di rendimento) o anche, per un periodo limitato con potenza, superiore a quella di targa (sovraccarico).

---

(1) In Svizzera si è calcolato che la « utilizzazione effettiva » nel 1937 dei motori elettrici corrispondeva a circa il 50 % della potenza installata (cfr. *Statistique Suisse des Fabriques* du 16 septembre 1937, Berne 1940, pag. 39*). Si confrontino i dati relativi alla trazione elettrica indicati a pag. 60* nota (1).

(2) Nel censimento delle industrie elettriche eseguito dall'Istituto Centrale di Statistica nel 1938 si è chiamata potenza efficiente la « massima potenza che la centrale può *praticamente* sviluppare, esclusi gli eventuali sovraccarichi ammissibili in via eccezionale ». (Questa definizione, specialmente per i piccoli impianti, non è stata ben compresa ed ha dato luogo a errori notevoli).

(3) Si riprenda l'esempio di uno stabilimento con due motori idraulici di 50 CV azionanti direttamente il macchinario che non possano sviluppare in media più di 62,5 CV (per ragioni inerenti al regime delle acque). Si confronti questo caso con quello di uno stabilimento con due motori a combustione interna, di 50 CV ciascuno, pure azionanti direttamente il macchinario. In entrambi i casi la potenza *installata*, di targa, è di 100 CV e così pure è di 100 CV quella teoricamente « utilizzabile » ma nel primo caso la potenza praticamente utilizzabile è di 62,5 CV, nel secondo di 100 CV.

Esiste quindi per la potenza « utilizzata » una potenza *media, normale, massima e minima.*

* * *

Si sono quindi distinte quattro specie di potenze: « installata », « teoricamente utilizzabile », « praticamente utilizzabile », « utilizzata ». Il presente studio intende riferirsi alla *potenza teoricamente utilizzabile.*

Si possono, esprimere preferenze per l'uno o per l'altro dei quattro concetti esposti, ma l'importante è di non confonderli o di usarli promiscuamente, come accade talvolta, attribuendo così al calcolo un significato incerto od equivoco. È pure indispensabile stabilire sempre, come si è detto all'inizio, per ciascuno dei quattro tipi di potenza calcolabili, a quale scopo si intende riferire la potenza determinata o da determinarsi. La maggior parte delle confusioni e degli equivoci dipende da queste mancate precisazioni.

Scelto uno dei quattro concetti (e fissato lo scopo del calcolo) esso va, in ogni caso, applicato uniformemente a tutti i rami di industria e tanto ai motori primari quanto ai generatori e ai motori elettrici.

In alcuni Paesi si usano criteri di calcolo o si dànno definizioni (o istruzioni) che portano o, quanto meno, sembrano portare — almeno da una letterale interpretazione delle norme — ad una confusione dei concetti suddetti. Abbiamo già ricordato al riguardo al punto *B*) il metodo usato dalla Svizzera in passato e modificato poi col censimento delle fabbriche del 1937. Anche il nuovo metodo usato nel 1937 per questo censimento sembra confondere i concetti esposti.

Nel questionario svizzero di rilevazione si chiedono infatti, per la potenza *primaria* due dati:

a) forza motrice installata (*installée*) (comprese le riserve) definita come « la potenza totale *massima* che può essere prodotta dalle installazioni generatrici di forza motrice esistenti nell'impresa stessa ». Questa sembra corrispondere al concetto di potenza installata (nominale o di targa).

b) La potenza « utilizzata » o « *d'exploitation* » o « *potenza necessaria* all'impresa, cioè *l'energia necessaria come forza motrice* ». Questa costituisce (secondo il questionario di rilevazione) una parte della potenza « installata » e viene definita « forza motrice prodotta in media *durante le ore di lavoro* » o energia « prodotta come forza motrice media ». Per i motori elettrici, per contro, si chiede la potenza nominale « installata » in CV.

Si sostituisce così al concetto di « capacità » teorica, di possibilità, un concetto ibrido basato in parte sulla « effettiva » utilizzazione in base alle ore di lavoro e in parte sulla « capacità » di produzione (1).

Nel *Regno Unito* si usano criteri univoci in quanto per i motori primari si fa riferimento alla « potenza effettiva in CV che essi *possono* sviluppare » e per i generatori e motori elettrici si fa riferimento alla potenza di targa (« rated » cfr. nota (3) a pag. 12*) che si suppone equivalente a quella effettiva. Tuttavia s'introduce una distinzione fra motori « ordinariamente in azione » (*ordinarily in use*) (che « furono in azione durante la *maggior parte dell'anno* ») e gli altri definiti come « in riserva o inattivi » (cfr. paragr. 23). Ciò porta, in pratica, a calcolare una potenza che non risponde a nessuno dei tre concetti suddetti, ma che è informata al criterio dell'impiego effettivo o della durata dell'effettivo azionamento (sia pure imprecisamente indicata « maggior parte » o « minor parte » dell'anno).

Negli *Stati Uniti d'America* il procedimento si avvicina a quello del Regno Unito ma lascia al censito un maggior margine di interpretazione. Si chiede infatti la potenza dei motori e generatori « attivi ed emergenti » (per « emergenti » si intendono i motori che possono essere prontamente azionati ma che sono usati soltanto in caso di interruzioni o guasti delle installazioni attive o a rari intervalli quando si deve far fronte ad un carico eccezionale) intendendo per attivi anche quelli usati « regolarmente » ma non sempre in continuazione o in pieno (*not usually on fulltime*) senza limiti di durata. È sempre latente il desiderio di considerare non la potenza « installata » ma quella attiva o « utilizzata » ordinariamente.

§ 5. - Gli scopi principali del calcolo della potenza. — La statistica delle macchine produttrici di energia deve innanzi tutto fornire tutti gli elementi necessari per il calcolo della « potenza » utilizzabile secondo il significato già chiarito nei precedenti paragrafi. Non si esclude, naturalmente, anche il calcolo delle altre specie di potenza (praticamente utilizzabile, utilizzata, ecc.: cfr. paragr. 4), ma, come si è già detto, lo scopo essenziale del pre-

(1) Poichè, in Svizzera, la potenza dei motori elettrici costituisce nell'industria oltre il 90 % della potenza globale installata, il difetto non porta rilevanti conseguenze pratiche per il complesso del Paese, ma può averne, per i singoli rami d'industria (ad es. nelle industrie del cotone, della carta, ecc.). Ma da un punto di vista metodologico esiste un errore di impostazione che porta a sommare cifre rispondenti a concetti diversi: per i motori primari (che azionano direttamente il macchinario) si usa la « potenza » effettivamente utilizzata — che è in funzione delle ore di lavoro — e per i motori elettrici, invece, una potenza « installata » che non è affatto in rapporto al lavoro effettivo (cfr. Statistique Suisse ecc. cit., pag. 38*, 59*, 5).

sente lavoro è il calcolo della potenza utilizzabile.

È di fondamentale importanza (cfr. pag. 5* e pag. 8*) distinguere due scopi fondamentali : *a*) per azionare il macchinario (potenza motrice propriamente detta) ; *b*) per altri usi (impieghi diretti di energia elettrica).

Per quanto riguarda lo scopo *a*) abbiamo finora considerato come macchinario anche i mezzi di trasporto elettrici (azionati da motori elettrici : trazione elettrica) e non elettrici (azionati da motori primari : autoveicoli in genere). È però evidente l'opportunità di distinguere il *macchinario vero e proprio* dai *mezzi di trasporto*. I mezzi di trasporto (motorizzati) servono infatti esclusivamente al trasferimento da un luogo all'altro di persone e cose (in sostituzione delle forze animali un tempo esclusivamente o quasi impiegate a tal fine) e non partecipano come elementi essenziali al processo industriale vero e proprio.

L'opportunità di tener separata la potenza destinata ai mezzi di trasporto è resa anche maggiormente evidente se si considera che essa rappresenta oltre il 70% della potenza globale utilizzabile (per tutti gli scopi) (Cfr. prosp. 7, pag. 67*). Occorre inoltre fare una netta distinzione fra *trasporti elettrici* e non elettrici, in quanto pei primi l'energia elettrica (azionante i motori elettrici «mobili») proviene da motori primari « fissi » (installati sul luogo o a distanza e azionanti a lor volta i rispettivi generatori) — allo stesso modo dell'energia elettrica che alimenta i motori elettrici « fissi » destinati ad azionare il macchinario — mentre per i secondi l'energia meccanica è fornita da motori primari mobili.

Possiamo quindi distinguere almeno i seguenti cinque scopi principali che *sempre* debbono essere indicati :

PRIMO SCOPO. — *Potenza destinata soltanto ad azionare il macchinario* (1) (2) — cioè macchine (apparecchi, attrezzi, utensili meccanici) — sia usando direttamente l'energia meccanica del motore primario (3) — a mezzo di cinghie, funi, snodi, ecc. — sia usando l'energia meccanica sviluppata dal motore elettrico. *Potenza meccanica* o potenza « motrice » « *potenza numericamente utilizzabile* ».

(1) Per lo scopo del presente lavoro non si considerano « macchinari » nè i motori primari, nè i generatori, nè i motori elettrici.

(2) Gli ascensori e montacarichi azionati da motori elettrici « fissi » vengono assimilati al « macchinario » e non ai trasporti.

(3) Si assimila al macchinario — e non ai mezzi di trasporto — anche, ad es., la *trattrice agricola*, che si limita spesso a trainare — in luogo degli animali — utensili e attrezzi agricoli, onde permettere a questi di compiere un lavoro meccanico.

SECONDO SCOPO. — *Potenza destinata a qualsiasi uso, esclusi i trasporti*. Si tratta cioè della potenza destinata oltre che ad azionare il macchinario (primo scopo) anche a impiego di energia elettrica per *usi diretti* (senza, cioè, l'intermediario del motore elettrico) vale a dire : per illuminazione, impieghi termici (caldaie elettriche, stufe elettriche, forni elettrici, forni elettrici di cottura, forni di fusione, ecc.) ; impieghi chimici (elettrolisi di acqua, di sali, ecc.) (4). (*Potenza meccanica e potenza elettrica*).

TERZO SCOPO. — *Potenza destinata a qualsiasi uso, compresi i trasporti* (elettrici e non elettrici). Agli impieghi di cui allo scopo precedente si aggiungono i trasporti, siano questi elettrici (ferrovie e tranvie elettriche, funivie, funicolari (5); ecc.) o non elettrici (locomotive a vapore, automobili, autocarri, navigli a motore, aeroplani). (*Potenza meccanica e potenza elettrica*).

QUARTO SCOPO. — *Potenza destinata a qualsiasi uso ed ai trasporti elettrici, esclusi i trasporti non elettrici*. Si tratta cioè di tutta la potenza corrispondente, *all'origine*, a motori primari « fissi ». (*Potenza meccanica e potenza elettrica*).

QUINTO SCOPO. — *Potenza destinata ad azionare il macchinario e i trasporti elettrici*. È *esclusa* quindi la potenza che ha come destinazione finale usi diretti di energia elettrica e quella destinata ai trasporti non elettrici. Si tratta cioè della potenza *primaria* impiegata *direttamente* ad azionare il macchinario o che si avvale come intermediario del motore elettrico « fisso » o « mobile » (quello dei veicoli elettrici). (*Potenza meccanica*).

In pratica è facile la confusione fra lo *scopo quarto* e lo scopo quinto in quanto non si attribuisce — a torto — grande valore alla differenza dei risultati ottenuti per i due scopi suddetti, differenza che è rappresentata dalla potenza destinata ad usi diretti. Questa è tutt'altro che trascurabile rappresentando in Italia il 46,7% della potenza primaria utilizzabile per azionare il macchinario (cfr. pag. 36* § 12 e prosp. 7, pag. 67*).

Spesso si incorre anche in una confusione fra secondo scopo e quarto scopo. La differenza fra i due risultati è costituita soltanto dalla potenza destinata alla trazione elettrica, anche essa non trascurabile (12,2% della potenza primaria destinata ad azionare il macchinario : cfr. pag. 67*). L'equivoco è facilitato dal fatto che per il secondo scopo si

(4) Si esclude l'energia prodotta da pile e accumulatori, che, per ora almeno, è trascurabile.

(5) Cfr. nota (2)

prende talvolta in considerazione la potenza di tutti i motori primari «fissi» ovunque installati, senza deduzione della potenza destinata alla trazione elettrica — che invece, per il secondo scopo, è esclusa dal calcolo — determinando così, in realtà, la potenza di cui allo scopo quarto. Gli errori potrebbero essere anche rilevanti nei confronti fra Stato e Stato (1).

Naturalmente si possono fissare anche altri scopi e in particolare, ad es., altri due (2):

a) (SESTO SCOPO): potenza utilizzabile per i soli usi diretti della energia elettrica (illuminazione, usi termici; usi elettrolitici): (*potenza elettrica*) (2) (cfr. prosp. 7, pag. 67*, col. 4);

b) (SETTIMO SCOPO): potenza utilizzabile dei mezzi di trasporto (elettrici e non) (*potenza meccanica*) (1) (cfr. prosp. 7, col. 6).

Nel presente studio ci limiteremo ai cinque scopi prima menzionati. L'estensione del calcolo ad altri scopi non presenta d'altronde particolari difficoltà.

* * *

La potenza di cui agli scopi suddetti può essere calcolata:

a) *come potenza globalmente utilizzabile nello Stato in tutte le possibili branche di attività;*

b) *come potenza utilizzabile in singoli stabilimenti, in ciascuna branca di attività, in ciascuna circoscrizione territoriale minore dello Stato.*

Questa distinzione è necessaria anche perchè i metodi da seguire per il calcolo della potenza sub *a*) possono essere diversi da quelli impiegati per il calcolo della potenza sub *b*), sebbene la somma delle potenze calcolate sub *b*), debba, *teoricamente*, corrispondere, per l'intero Stato, alla potenza sub *a*).

* * *

Diciamo subito che per calcolare la potenza *globalmente utilizzabile nello Stato* per lo scopo quarto — e solo per questo — basterebbe rilevare in occasione ad es. di un ipotetico censimento totalitario esteso ad ogni attività (economica o non) la potenza dei soli motori *primari* «fissi», installati nello Stato (3) e farne la somma. Non occorrerebbe cioè rilevare nè la potenza dei motori elettrici nè quella dei generatori e nemmeno quella dei motori «mobili» dei veicoli motorizzati, non elettrici (3).

La grande semplicità del calcolo fa sì che circolino spesso dati statistici sulla potenza globale dei diversi Stati determinata appunto sommando la potenza dei soli motori primari «fissi». Viene però, spesso, trascurato di indicare la natura di detta potenza, quando non la si consideri addirittura come «forza motrice» mentre si tratta, in questo caso, di forza motrice ed elettrica riferentesi inoltre, anche ai trasporti elettrici. Comunque i dati, per essere consistenti e comparabili, debbono essere totalitari, riguardare cioè censimenti estesi ad ogni branca di attività, industriale o non (ciò che accade di rado). La parzialità della rilevazione rischia di far incorrere in errori e di far perdere ai risultati il loro significato reale (cfr. paragr. 20 pag. 50* punto *c*).

Per lo scopo terzo occorrerebbe estendere il censimento ai motori mobili dei veicoli motorizzati non elettrici (4).

Per tutti gli altri tre scopi occorre invece rilevare anche la potenza dei motori elettrici e dei generatori.

Quando poi si debba calcolare la potenza disponibile in *ciascuno stabilimento* e in ciascuna *branca di attività*, è opportuno — per tutti i cinque scopi suddetti — non solo rilevare la potenza di ciascun motore primario, generatore e motore elettrico, ma è consigliabile distinguere i motori primari che azionano direttamente il macchinario da quelli che sono accoppiati a generatori (gruppi elettrogeni), mentre i motori elettrici vanno distinti in due categorie: *a*) azionati da energia elettrica prodotta all'interno dello stesso stabilimento che l'impiega; *b*) azionati da energia fornita dall'esterno (acquistata) (cfr. paragr. 2 pag. 8*).

* * *

Un quadro schematico e simbolico contenente i dati più importanti di una statistica delle potenze utilizzabili è dato dal prospetto 1.

---

(1) Uno Stato A con trasporti a trazione elettrica molto sviluppati figurerebbe con una potenza globale dei motori primari «fissi» assai superiore a quella corrispondente di uno Stato *B* che, pur disponendo della stessa potenza impiegasse, anzichè locomotive elettriche, locomotive a vapore di uguale potenza.

La distinzione formale fra motori «fissi» e motori «mobili», in periodi di crescente sviluppo della trazione elettrica è fonte di equivoci e va evitata — o molto ben chiarita — nel calcolo della potenza utilizzabile (cfr. par. 6, punto *E*) e par. 24).

(2) Lo scopo *a*) può essere risuddiviso onde calcolare la potenza elettrica disponibile per: la sola illuminazione; i soli usi termici; i soli usi elettrici; usi combinati.

Lo scopo *b*) può essere suddiviso in due parti onde calcolare la potenza meccanica disponibile per azionare: i soli trasporti elettrici; i soli trasporti non elettrici.

Si può fissare come *scopo*, anche quello *della vendita di energia* (elettrica), qualunque sia l'uso a cui è destinata, ecc.

(3) Si esclude nel presente studio che vi sia importazione od esportazione di energia elettrica: occorrerà quindi depurare preliminarmente i dati da usare dalle potenze corrispondenti al commercio estero, a meno che si tratti di quantità trascurabili. (In Svizzera su circa 5.000.000 kWh di energia venduti nel 1936-37 circa 1.600.000, cioè oltre il 30 % sono esportati). In altre parole occorrerà dedurre la potenza dei motori *primari* corrispondenti all'energia elettrica eventualmente venduta ad altri Stati e aggiungere la potenza dei motori *elettrici* installati nello Stato eventualmente alimentati da energia elettrica fornita da altri Stati.

(4) Il dato sarebbe di grande interesse per i confronti nel tempo tra i vari Stati alla stessa epoca, ma non è ancora stato calcolato in Italia con sufficiente approssimazione (Cfr. § 25).

Prosp. 1. — QUADRO SCHEMATICO E SIMBOLICO SULLA POTENZA UTILIZZABILE.

GRANDI BRANCHE DI ATTIVITÀ (2)	POTENZA UTILIZZABILE (1) PER :

(1) S'intende la potenza (espressa in CV o in kW) corrispondente all'energia *originariamente* prodotta come *energia meccanica* (esclusa quella umana o animale) : è quindi compresa anche la potenza corrispondente all'*energia elettrica* impiegata per qualsiasi uso.

(2) Compresi gli *uffici pubblici* e anche le *aziende domestiche*.

(3) Per l'azionamento (con motori primari o elettrici) di macchine, apparecchi, attrezzi, utensili — meccanici — ma non la potenza per azionare motori (elettrici o non) degli automezzi che è indicata alle coll. 5, 6, 7.

(4) Potenza corrispondente all'energia elettrica consumata per illuminazione, riscaldamento, elettrolisi, ecc. (Sesto scopo). È esclusa la potenza corrispondente all'energia elettrica consumata per azionare automezzi elettrici : col. 6.

(5) Settimo scopo Cfr. paragr. 24.

(6) Per gruppi, categorie, classi e sottoclassi. L'*industria elettrica* (per la produzione di energia elettrica) deve formare una classe a parte e figura, nelle rispettive colonne del quadro, soltanto per la modesta parte di potenza eventualmente destinata, all'interno delle stesse centrali, rispettivamente per : *a*) ad azionare macchinari (col. 2) di officine meccaniche di riparazioni e simili annesse alle centrali ; *b*) ad illuminazione e riscaldamento eventuale dei locali delle centrali (col. 3) ; *c*) ad eventuali trasporti a trazione elettrica a servizio della centrale (col. 6) ; *d*) ad automezzi di trasporto non elettrici al servizio della centrale (col. 7). È opportuno raggruppare le altre sottoclassi e classi di industria in due gruppi : *industrie estrattive* e *industrie di trasformazione*. *Esclusi i cosiddetti servizi* (dello spettacolo, servizi di pulizia, ecc.). Cfr. nota (8).

(7) Imprese di trasporto : terrestri, per via d'acqua, aeree.

(8) Per grandi categorie, classi e sottoclassi, compresi i *servizi* e le attività non economiche (uffici pubblici, aziende domestiche, ecc.). I *servizi* (spettacolo, servizi di pulizia personale e pubblici, ecc.) debbono costituire una classe a sè.

(9) *Il metodo per calcolare la potenza complessiva dello Stato può differire da quello impiegato per calcolare la potenza nelle diverse branche di attività.*

Nota. — I simboli stampati in *neretto* indicano i dati di maggiore importanza, calcolabili *direttamente* in base ai risultati dei censimenti o di rilevazioni periodiche comunemente eseguiti, gli uni e le altre, nella maggior parte degli Stati con adeguata attrezzatura statistica nazionale.

* * *

Lo scopo più importante riguarda il calcolo della potenza « meccanica » (forza motrice) utilizzabile per azionare i macchinari, attrezzi ed utensili meccanici (M), per il complesso dello Stato e per ciascuna branca di attività e relative classi e sottoclassi. E fra queste sovratutto il dato relativo alla branca « industria » (M_I). Sebbene questa potenza costituisca una frazione modesta della potenza globale complessiva C (1) il calcolo è più frequentemente eseguito in tutti gli Stati ed è considerato, come di particolare importanza, in quanto la potenza, da una parte, integra o sostituisce il lavoro umano (cfr. paragr. 2 pagg. 6* e 7*) nel processo produttivo di estrazione delle materie prime e della loro trasformazione in beni strumentali o di consumo e, dall'altra, fornisce elementi per giudicare, nel tempo, i progressi della motorizzazione o meccanizzazione dell'industria (CV per operaio o per addetto).

§ 6. - Presupposti e criteri generali del calcolo. — A) *Dati teorici e reali*. Si prescinde, innanzi tutto, come si è detto alla fine del paragrafo 3, dalle perdite di potenza che si verificano nel passare : dal motore primario al macchinario da esso direttamente azionato ; dal motore primario al generatore ; dal generatore al motore elettrico ; dal motore elettrico al macchinario. Questa supposizione è in contrasto con la realtà, ma è necessario mantenerla per la corretta impostazione dei calcoli e, principalmente, per evitare omissioni o duplicazioni di conteggi — che introdurrebbero errori molto più gravi — salvo poi interpretare nel dovuto modo i risultati (cfr. paragr. 20) (2).

B) *Concetti informativi del calcolo*. — Grazie al l'ipotesi fatta al punto precedente uno dei criteri base seguito nei calcoli per determinare la potenza installata si fonda sul concetto di ritrovare l'energia meccanica *originariamente* sviluppabile dal motore primario (cioè la sua potenza) sotto forma di pari potenza del motore elettrico (azionato dall'interno o a distanza) da esso alimentato (a mezzo del generatore) ed impiegato per azionare il macchinario. Ciò significa che, in questo caso, la potenza dei motori primari può essere conteggiata, anzichè dove sono installati i motori primari, nel luogo (che può essere distante centinaia di chilometri) ove si trovano i motori elettrici da essi alimentati, considerando la potenza di questi equivalente a quella dei motori che li alimentano. Si può cioè calcolare sul *luogo di consumo* anzichè sul *luogo di produzione* (cfr. paragr. 1 pag. 4* e seg.).

---

(1) Meno di un quarto, ad es., in Francia (nel 1926 : 8.790.000 kW su 34.080.000). (Cfr. STATISTIQUE GÉNÉRALE DE LA FRANCE, *Statistique des forces motrices en* 1926, Paris, 1931, « Introduction » di M. HUBER, pag. 8). In realtà la percentuale dovrebbe essere minore in quanto la potenza attribuita alle automobili (6.310.000 kW) è quella fiscale, che si afferma essere circa un terzo di quella effettiva (cfr. par. 4, pag. 13* nota (2) : la percentuale si abbasserebbe al 17 %). In Italia meno del 30,0% (Cfr. § 25 prosp. 7 pag. 67*).

(2) Poichè i risultati ottenuti possono essere, in eccesso o in difetto, rispetto alla realtà, si viene implicitamente a considerare che le differenze percentuali in più od in meno rispetto alla realtà stessa, si mantengano invariate nei confronti nello spazio, nel tempo e tra i vari rami d'industria. Ciò che non è. Se d'altra parte non si volessero accettare queste supposizioni si dovrebbe rinunciare alla conoscenza di dati di grande importanza per le statistiche industriali, importanza che sussiste malgrado il grossolano significato dei risultati.

Quanto più vicini nel tempo saranno i confronti e quanto più simili saranno le condizioni di impiego delle forze motrici dei rami di attività o dei vari Stati posti a confronto, tanto più attendibili saranno le conclusioni, specialmente se si saranno usati criteri corretti e uniformi di calcolo.

Si può cioè far corrispondere ad una determinata capacità di *produzione* di energia meccanica (del motore primario) un'uguale capacità di produzione di energia elettrica (del generatore) e una corrispondente capacità di produzione di energia meccanica, sul luogo di consumo (del motore elettrico). Queste supposizioni, semplificatrici dei conteggi, possono evidentemente sfruttarsi solo dove esistono motori elettrici, rivelatori della potenza primaria che indirettamente li alimenta (1). Non sono invece sfruttabili — o sono di più difficile applicazione pratica — per gli *usi diretti* della energia elettrica (per illuminazione, per riscaldamento, per forni elettrici (2), batterie di elettrolisi, ecc.), cioè quando non esiste fra il motore primario « produttore » di energia « meccanica » ed il « consumatore » (o assorbitore) dell'energia « elettrica » (macchina, lampadina elettrica, forno elettrico; batteria di elettrolisi, ecc.) l'intermediario « motore elettrico » (cfr. paragr. 5 pag. 17* e il prosp. 3 a pag. 40*).

C) *La « quadratura » dei dati.* Per l'attendibilità e la congruenza delle valutazioni è necessario porre come presupposto *teorico* — qualunque siano i metodi impiegati per il calcolo — la condizione che la *somma delle cifre relative alle potenze utilizzabili in ciascuna branca di attività* (o provincia, regione, ecc.) *corrisponda alla potenza complessiva dello Stato* (cfr. paragr. 5 pag. 21*).

Questa condizione appare ovvia, in teoria, ma non lo è in pratica sopratutto perchè il metodo per calcolare i dati parziali (addendi) per ciascun ramo di attività, differisce spesso — anche per ragioni di comodità di calcolo — da quello impiegato per calcolare direttamente il dato globale dell'intero Stato, come dato a sè stante e relativo a tutti i rami di attività.

Qualora il metodo di calcolo impiegato sia lo stesso tanto per il singolo stabilimento, o ramo d'attività, quanto per la potenza globale utilizzabile nello Stato la condizione suddetta si realizzerebbe automaticamente. A questa identità di metodo si ispirano le ricerche delle formule più adatte al calcolo.

D) *Approssimazione dei calcoli e « doppi impieghi ».* Si avverte che l'*approssimazione grossolana alla realtà è nella natura stessa dei calcoli* i quali lasciano aperta per molti elementi la via al calcolo congetturale e alle stime (cfr. paragr. 20). Il fine principale dei calcoli è quello di evitare, oltre che omissioni, delle duplicazioni (i cosidetti *doppi impieghi*) che introducono talvolta gravi errori nei conteggi (cfr. paragr. 17).

E) *Conseguenze dell'esclusione dei « trasporti ».* — Abbiamo già accennato alla opportunità di tenere separate, nel calcolo della potenza, la potenza relativa ai trasporti. Questa separazione provoca in pratica diverse complicazioni (come si vedrà meglio al § 24) dovute alla necessità di isolare la potenza relativa ai *trasporti elettrici*, i quali sono effettuati mediante il concorso di motori primari, di generatori e di motori elettrici « mobili ». Mentre questi ultimi sono facilmente enumerabili — e quindi è facile conoscerne la potenza — la potenza dei motori primari e dei generatori che li azionano non sempre può essere determinata direttamente perchè, in Italia, motori primari e generatori installati, ad es., in una centrale, possono produrre energia elettrica destinata, anche contemporaneamente, alla trazione elettrica e a tutti i numerosi altri usi. (Negli altri mezzi di trasporto non elettrici, invece, esiste solo un motore primario « mobile » che si muove con il veicolo).

Forse per queste, o per altre circostanze, si è accertato l'errore in cui talvolta si incorre (cfr. paragr. 17 e 24) nel calcolo delle potenze installate e particolarmente nel calcolo della potenza *globalmente* installata in uno Stato per lo scopo primo e secondo (che non deve tener conto della potenza dei mezzi di trasporto). Questa viene spesso determinata sommando tutte le potenze dei motori primari « fissi » installati nello Stato, dimenticando di dedurne la potenza destinata alla trazione elettrica.

Nè può dirsi — attualmente — che l'errore che si commette sia trascurabile. In Italia su una potenza primaria di 11 milioni di kW (esclusi i trasporti non elettrici), il 7,7% si può supporre destinato alla trazione elettrica (FF. SS., tramvie elettriche, comunali e intercomunali) (cfr. prosp. 7, pag. 67*).

L'osservazione acquista particolare rilievo quando il calcolo della potenza venga limitato soltanto ad alcune branche di attività che possono impiegare

---

(1) In *Italia* (1937-39) si può considerare che oltre lo 85% della potenza utilizzabile per azionare il macchinario delle industrie sia fornito da motori elettrici; in Svizzera (1937) il 94,4%; in Inghilterra (1930) il 65,6%, ecc. in Germania (1933) il 71%.

(2) I forni elettrici installati nelle industrie hanno indicata — sul forno stesso — la potenza in kW e questa potenza potrebbe considerarsi, agli effetti dei nostri calcoli alla stessa stregua di quella dei motori elettrici se i forni stessi venissero censiti in occasione dei censimenti industriali, ciò che non è stato finora fatto in Italia. Solo ai censimenti industriali del 1938 si richiesero per alcune industrie (carburo calcio) la potenza in kW. Per le batterie di elettrolisi non vi è invece indicazione di potenza (nel censimento si chiese solo la produzione del gas ottenuto; idrogeno, ossigeno, ecc.). Nelle statistiche della *Norvegia* viene sempre indicata a parte nei volumi della « Statistica industriale » o delle « Industrie manifatturiere », miniere, ecc.» la potenza elettrica per elettrolisi ed elettrometallurgia, potenza che nel 1918, ad es., era di 535.000 CV, superiore a quella dei motori elettrici di 390.000 CV; nel 1930 si avevano 909.000 CV contro 686.000 CV dei motori elettrici.

forza motrice (ad es., calcolo della potenza delle sole industrie vere e proprie che comprendono le industrie elettriche fornitrici di energia per trasporti elettrici).

Pertanto, con riguardo al prosp. 1, ogni qualvolta si consideri la potenza installata per azionare il macchinario (M) o per usi diretti (U) e per entrambi questi scopi (T) si dovrà sempre escludere la potenza destinata alla trazione elettrica (R) sia per il complesso dello Stato che per ogni singolo stabilimento. La potenza di tutti i motori « fissi », (F), installati nello Stato — esclusi i motori primari « mobili » degli automezzi, ma compresa la potenza primaria che serve a produrre energia per la trazione elettrica (con motori elettrici « mobili ») — è:

$$F = M + U + R$$

ed essendo $T = M + U$ sarà $F = T + R$ e quind $T = F - R$

F) *I dati statistici disponibili per il calcolo.* — È evidente che la possibilità di calcolare la potenza utilizzabile per ciascuno degli scopi principali indicati al § 5 è in funzione dei dati statistici disponibili.

Si deve quindi stabilire di quali dati è necessario disporre per eseguire il calcolo, per ciascuno degli scopi indicati, e, inversamente, per quali scopi è possibile eseguire il calcolo disponendo di determinati dati statistici. Disponendo, ad es., soltanto dei dati relativi alla potenza dei motori primi installati sarà possibile, come si è detto (cfr. § 5 pag. 21*) calcolare solo la potenza complessivamente utilizzabile nell'intero Stato per lo scopo quarto. Non si potrebbe quindi eseguire il calcolo nè per singoli stabilimenti, nè per circoscrizioni territoriali minori dello Stato, nè, per l'intero Stato, per scopi diversi dal quarto.

In pratica alcuni elementi necessari per il calcolo non vengono generalmente rilevati: tali, ad es., i dati sulla potenza delle installazioni dirette consumatrici (cfr. § 4 pag. 17*) di energia elettrica (impianti di illuminazione, forni elettrici, batterie di elettrolisi, ecc.). Questi elementi potranno quindi, in pratica, essere ricavati soltanto per differenza o congetturalmente o a calcolo. Ciò non significa che di essi non si debba tener conto nelle formule generali, essendo anzi indispensabile che queste diano modo di giudicare immediatamente se i dati statistici rilevati siano o meno sufficienti allo scopo e quali siano le eventuali lacune.

Nell'esaminare quindi le diverse formule generali si accennerà, di volta in volta, se ed in qual modo sia possibile calcolare (per differenza o congetturalmente) il valore dei dati statistici che non vengono normalmente rilevati.

La disponibilità di dati statistici sulla potenza delle macchine generatrici di energia, installate in uno stabilimento, varia generalmente da un minimo ad un massimo:

a) minimo: si conoscono soltanto i dati relativi alla potenza di tutti i motori primari (fissi); alla potenza di tutti i motori elettrici (fissi) e di quelli azionati dall'esterno;

b) massimo: si conoscono i dati relativi alla potenza dei motori primari (fissi e mobili): azionanti direttamente il macchinario, azionanti i generatori, azionanti promiscuamente l'uno e gli altri; alla potenza dei generatori; alla potenza dei motori elettrici (fissi e mobili): azionati dall'interno; azionati dall'esterno; azionati promiscuamente dall' interno e dall' esterno. (Cfr. *Allegato*):

Talvolta si rilevano anche altri elementi sussidiari, relativi all'energia elettrica venduta, alle ore di erogazione, all'energia acquistata per usi diretti, alla potenza dei forni elettrici, ecc. Questi dati sono spesso richiesti per scopi estranei al calcolo in parola, ma possono essere utilizzati a questo fine.

È sulla base di queste normali disponibilità di dati che si svolgeranno le considerazioni dei paragrafi seguenti.

PRIMO SCOPO

POTENZA UTILIZZABILE AL SOLO SCOPO DI AZIONARE IL MACCHINARIO

§ 7. - Il « macchinario ». — Il calcolo della potenza installata ai soli fini di azionare il *macchinario*, viene spesso riferito, in pratica, al macchinario delle « industrie » vere e proprie per tre motivi: per il significato intrinseco del dato ottenuto (complemento o integrazione del lavoro manuale nel processo di estrazione e di trasformazione delle materie prime); perchè il macchinario installato nelle industrie vere e proprie costituisce — anche, e sopratutto, se riferito al lavoro meccanico compiuto — la grande massa del « macchinario »; e, infine, perchè è di più frequente determinazione in occasione dei censimenti industriali eseguiti nella maggior parte degli Stati.

Questa più frequente limitazione del calcolo alla branca « industrie » non deve però influire sul significato intrinseco del calcolo. In realtà una distinzione tra « macchinario » installato negli stabilimenti di industrie vere e proprie e « macchinario » installato presso esercizi di altri rami di attività non ha ragion d'essere.

Il motore primario (Diesel) e il generatore elettrico installati, ad esempio, presso l'Istituto Centrale di Statistica per azionare i motori elettrici delle macchine calcolatrici e di spoglio meccanico, non possono essere considerati diversamente, dai motori e dal macchinario di una qualsiasi industria o di qualsiasi ramo di attività economica. Così dicasi ad es., di un motore elettrico: accoppiato ad un frigorifero o a uno spazzolone elettrico in una azienda domestica; installato in una casa di abitazione, o in un grande magazzeno, per azionare l'ascensore; in un negozio di colori, per azionare un piccolo molino ecc. Il frigorifero, lo spazzolone, l'ascensore, il molino, sono « macchinari » azionati da motori elettrici. Anch'essi sostituiscono al lavoro umano, animato, il lavoro meccanico inanimato.

Quindi le osservazioni riferite al macchinario delle « industrie » si possono estendere al « macchinario » di qualsiasi altra branca di attività economica o non economica compresi gli uffici pubblici e le aziende domestiche.

S'intende che *non si considerano come « macchinari » nè i motori primari, nè i generatori, nè i motori elettrici*. Quindi una centrale elettrica (che non possieda attrezzi o utensili meccanici per servizi ausiliari) non ha installato alcun « macchinario ». Questa osservazione è necessaria perchè nella determinazione della potenza dei motori primari installati nell'industria elettrica può sorgere equivoco: si usa, infatti, talvolta parlare di « macchinario » installato, nelle centrali elettriche intendendo il « macchinario elettrico » cioè il complesso di motori primari, generatori, alternatori, trasformatori elevatori, eccitatrici e servizi ausiliari. Non si considerano «macchinari» i motori elettrici dei veicoli a trazione elettrica.

§ 8 - Ipotesi preliminare. — Il calcolo della potenza utilizzabile ai soli fini di azionare il macchinario non presenta particolari difficoltà e ad esso si è già accennato indicando anche una formula generale (cfr. paragr. 4 nota 1, pag. 15*). Data però l'importanza e la diffusione del calcolo stesso in tutti i Paesi, si è ritenuto opportuno — anche per eliminare ogni incertezza di interpretazione — di passare in rassegna tutti i casi possibili, dai più semplici ai più complessi, riferendoli a precise circostanze di fatto e risalendo dal caso particolare al caso generale. Tale procedimento analitico ed elementare implica parziali ripetizioni di cose già dette, ma è parso conveniente per una trattazione esauriente della questione.

(Si richiama, fra l'altro, quanto è stato detto al punto *F*) del paragr. 6). Cominceremo da una *ipotesi preliminare*, la più semplice possibile — anche se teorica — supponendo:

1) *che la potenza dei motori installati in uno Stato sia destinata esclusivamente ad azionare macchinari di stabilimenti industriali* veri e propri e che quindi nello Stato considerato non esista nessun altro impiego dell'energia prodotta dai motori primari (cioè non esista ad es., nè illuminazione elettrica, nè energia elettrica impiegata per riscaldamento, elettrolisi, ecc., nè energia impiegata per trasporti elettrici);

2) che gli stabilimenti industriali veri e propri — escluse le centrali elettriche — che producano nei propri stabilimenti della energia elettrica la destinino tutta ad azionare i macchinari del loro stesso stabilimento senza venderne alcuna parte ad altri stabilimenti;

3) che gli stabilimenti dell'industria elettrica (centrali elettriche), per contro, vendano tutta l'energia elettrica prodotta per gli scopi di cui al punto 1) ;

4) che non esistano macchinari o motori *in riserva* (cfr. paragr. 23) ma che *tutta* la potenza dei motori installati venga utilizzata per azionare *tutto* il suddetto macchinario e soltanto questo.

a) *Potenza utilizzabile in ciascuno stabilimento.* — Tutti i casi possibili possono ridursi ai seguenti :

1° CASO - *Nello stabilimento sono installati soltanto motori primari.* — Il macchinario degli stabilimenti è azionato esclusivamente dai motori primari con i quali è direttamente e meccanicamente accoppiato (mediante puleggie, cinghie, ecc.). La potenza complessiva utilizzabile (o installata) nel singolo stabilimento, per azionare il macchinario, corrisponde perciò alla somma delle potenze di ciascun motore primario (1).

Basterebbe, quindi, nel caso ipotizzato, rilevare in occasione dei censimenti soltanto i motori primari e la loro potenza.

2° CASO - *Nello stabilimento sono installati, motori primari, generatori elettrici e motori elettrici.* — In uno stabilimento è installato un motore primario di 100 CV, la cui energia meccanica viene *tutta* impiegata per azionare un generatore di 100 CV, e questo destina *tutta* l'energia elettrica prodotta ad azionare a sua volta *tutti* i motori elettrici di 100 CV installati nello stabilimento stesso, che fanno funzionare in tal modo *tutto* il macchinario ivi installato. È evidente che la potenza utilizzabile è sempre e soltanto di 100 CV (quanta, cioè, ne può assorbire il macchinario), come nel 1° caso in cui il motore primario azionava direttamente il macchinario. Per esprimere la potenza utilizzabile in quello stabilimento si può quindi prendere indifferentemente, in questo caso, o la potenza dei motori primari o quella dei motori elettrici o quella dei generatori.

Nel caso in esame sarebbe pertanto sufficiente che nel questionario di rilevazione si chiedessero notizie o soltanto dei motori primari come nel primo caso, oppure dei soli motori elettrici, oppure dei soli generatori.

3° CASO - *Nello stabilimento sono installati soltanto motori elettrici.* — Supponiamo che il motore primario (di 100 CV) e il relativo generatore elettrico (di 100 CV) di cui al caso precedente, siano installati in uno stabilimento *A* di produzione di energia elettrica (centrale elettrica) nel quale motore primario e generatore funzionano per vendere l'energia elettrica prodotta soltanto ad uno stabilimento *B*. Questo userà quindi soltanto motori elettrici azionati dall'esterno (di 100 CV) per far funzionare il proprio macchinario. La potenza installata e utilizzabile nello *stabilimento* B per azionare il macchinario è sempre e soltanto di 100 CV, cioè la potenza dei motori elettrici installati e tutti azionati con corrente prodotta all'esterno (dalle centrali elettriche).

4° CASO - *Sono installati nello stabilimento motori primari e motori elettrici.* — I motori primari sono *tutti* impiegati per azionare direttamente il macchinario, ed i motori elettrici sono *tutti* alimentati con energia elettrica fornita dall'esterno (energia acquistata da una centrale elettrica).

La potenza complessivamente installata e utilizzabile nello stabilimento per azionare il macchinario è, evidentemente, eguale alla potenza di tutti i motori primari aumentata della potenza di tutti i motori elettrici (in questo caso azionati solo dall'esterno). Il caso 4° non è che l'insieme del caso 1° e del caso 3°.

5° CASO - *Sono installati nello stabilimento motori primari, generatori e motori elettrici.* — I motori primari come nel caso 2° sono *tutti* impiegati per alimentare i motori elettrici dello stabilimento, ma in questo sono installati anche altri motori elettrici, alimentati con energia elettrica fornita dall'esterno.

La potenza, come nel caso 3°, complessivamente installata e utilizzabile nello stabilimento sarà uguale alla potenza di tutti i motori primari installati (o alla potenza dei generatori o a quella dei motori elettrici, come nel caso 2°) aumentata della potenza di tutti i motori elettrici azionati dall'esterno. Il 5° caso non è che la combinazione del caso 2° e del caso 3°.

6° CASO - *Motori primari, generatori e motori elettrici.* — I motori primari sono impiegati *in parte* per azionare direttamente il macchinario e per l'altra parte per alimentare motori elettrici installati nello stabilimento (con l'intervento, quindi, di *generatori elettrici*). Epperò *tutti* e *soltanto* i motori elettrici installati sono alimentati (per mezzo di generatori elettrici) da quella parte dei motori primari che non viene destinata ad azionare direttamente il macchinario.

Per calcolare la potenza complessivamente installata nello stabilimento si possono seguire tre sistemi (a seconda dei dati di cui si dispone o di cui può sembrare più facile la rilevazione) :

a) sommare la potenza di *tutti* i motori primari installati. Sono infatti questi e solo questi che sviluppano l'energia (o direttamente o per il tramite

(1) Questo caso può considerarsi estensibile — per il terzo scopo — a quello dei mezzi di trasporto non elettrici (autovetture, autocarri, navi a vapore, aeroplani, ecc.).

dei generatori elettrici) necessaria e sufficiente per azionare il macchinario dello stabilimento;

b) calcolare la potenza dei soli motori primari che azionano *direttamente* il macchinario — detraendo dalla potenza di targa dei motori primari, quella dei generatori — ed aggiungervi la potenza dei motori elettrici (azionati dall'interno, dalla restante parte dei motori primari, a mezzo dei generatori) oppure, ciò che fa lo stesso, aggiungervi la potenza dei generatori elettrici (eguale a quella dei motori elettrici).

Il 6° caso non è che la combinazione del 1° caso e del 2° caso.

7° CASO - *Motori primari, generatori e motori elettrici.* — Si verifica l'ipotesi del caso precedente, ma esistono nello stabilimento anche altri motori elettrici azionati con energia fornita dall'esterno (acquistata).

Per calcolare la potenza complessivamente installata si procede come nel 6° caso precedente, aggiungendo, però come è ovvio, la potenza dei motori elettrici azionati dall'esterno.

Il caso 7° si può considerare come una combinazione di tutti gli altri casi. Si può, cioè, considerare come il *caso generale* da cui derivare una formula per il calcolo della potenza installata negli stabilimenti.

* * *

Poichè, per ipotesi, la potenza dei generatori elettrici si suppone eguale alla potenza dei motori primari che vengano destinati ad alimentarli e, analogamente, la potenza dei detti generatori si suppone eguale alla potenza dei motori elettrici da loro alimentati, ne consegue che quando nello stesso stabilimento sono installati motori primari, generatori e motori elettrici (casi 2°, 5°, 6° 7°) la potenza dei *motori primari destinati soltanto ad azionare direttamente il macchinario* — ove tale dato non sia stato richiesto nel questionario di rilevazione — *si può ottenere per differenza, detraendo dalla potenza complessiva di tutti i motori primari installati la potenza dei generatori elettrici* (nei casi 2° e 5° la differenza è uguale a zero).

Per calcolare quindi — nell'ipotesi preliminare considerata — la potenza utilizzabile in tutti gli stabilimenti industriali di uno Stato (esclusa l'industria produttrice dell'energia elettrica: caso 8°) si può procedere con uno dei tre criteri seguenti (la scelta dell'uno o dell'altro dipende, sopratutto, dai dati di cui si dispone o di cui può sembrare più facile la rilevazione):

Criterio A) sommare la potenza di tutti i motori primari e aggiungervi la potenza dei soli motori elettrici azionati dall'esterno;

Criterio B) sommare la potenza dei soli motori primari che azionano direttamente il macchinario e aggiungervi la potenza di tutti i motori elettrici installati;

Criterio C) dedurre dalla potenza di tutti i motori primari installati la potenza di tutti i generatori elettrici e aggiungere la potenza di tutti i motori elettrici installati.

Ove non si conosca la potenza dei motori elettrici azionati dall'esterno — quando cioè tale dato non sia richiesto nei questionari di censimento — questa (per il criterio *A*) si può ricavare per differenza detraendo dalla potenza complessiva di tutti i motori elettrici la potenza dei generatori elettrici.

8° CASO - *Industria elettrica - Motori primari e generatori.* — Facciamo ora il *caso dell'industria elettrica*, cioè di uno stabilimento (centrale elettrica) che produca energia elettrica, con motori primari e generatori, soltanto per *venderla* ad altri stabilimenti industriali che — in conformità all'ipotesi preliminare — la useranno esclusivamente per azionare (a mezzo dei motori elettrici ivi installati) il loro macchinario. Si suppone quindi che nella centrale elettrica non sia installato nessun macchinario nel senso e per lo scopo da noi fissato e cioè, macchinario che assorba energia *meccanica* per compiere un lavoro meccanico. Si suppone altresì che non esistano motori elettrici (azionanti eventuali officine meccaniche installate presso la centrale: esse si potrebbero considerare come stabilimenti a sè stanti, staccati dalla centrale). La *potenza della centrale* sarà quindi, in armonia al primo scopo, eguale a: *zero* CV, non essendovi in essa installato alcun macchinario nel senso da noi già indicato al paragr. 7. *Per il nostro calcolo la centrale elettrica è come se non esistesse.*

b) *Somma delle potenze utilizzabili in ciascun stabilimento.* — Gli otto casi sopra esemplificati si possono considerare rappresentativi di tutti i casi possibili (1) e quindi si può immaginare che compren-

(1) In uno stabilimento infatti possono essere installati: o soltanto motori primari (caso 1°), o soltanto motori elettrici (caso 3°), o motori primari e motori elettrici (caso 4°); o motori primari, generatori e motori elettrici (casi 2°, 5°, 6°, 7°) o motori primari e generatori (caso 8°).

Altri casi non sono praticamente possibili in quanto non si verifica nè il caso di un generatore elettrico isolato, nè di un generatore elettrico e di un motore elettrico isolati (senza cioè il motore primario che azioni il generatore elettrico). D'altronde abbiamo considerato sia il caso che i motori primari azionino direttamente il macchinario (casi 1° e 4°), sia il caso che azionino in parte il macchinario e in parte generatori (casi 6° e 7°); ed infine abbiamo considerato anche il caso che i motori elettrici siano azionati: soltanto dall'interno stesso dello stabilimento (casi 2° e 6°), o soltanto dall'esterno (casi 3° e 4°), o dall'interno e dallo esterno (casi 5° e 7°).

Si possono immaginare altri casi specialissimi ed eccezionali, ma essi non avrebbero alcun interesse pratico.

dano tutti gli stabilimenti industriali dello Stato, sempre rispettando le condizioni poste nell'ipotesi preliminare.

La potenza di tutti gli stabilimenti industriali (casi 1° a 7°), si può calcolare nell'identico modo con cui si è calcolata la potenza del caso 7°, che è rappresentativo del caso generale secondo i criteri *A*), *B*), *C*), indicati. Dato che la potenza installata nell'industria elettrica o nelle ipotesi fatte (caso 8°) è eguale a *zero* la *potenza complessiva installata in tutto lo Stato*, corrisponderà alla potenza di tutti gli stabilimenti industriali determinata con uno dei tre criteri *A*), *B*), *C*), suddetti *esclusa l'industria elettrica* (o compresa con potenza zero).

Questa esclusione ha sollevato obbiezioni e provocato incertezze. Sembra assurdo — si osserva — attribuire una potenza utilizzabile di zero CV ad una attività economica che in realtà ha installati motori *primari* con una potenza assai superiore a quella dei motori *primari* di ogni altro ramo di industria e di tutti gli altri rami di industria messi assieme. In Italia ad es. (nel 1939) la potenza dei motori *primari* dell'industria elettrica è di 7,4 milioni di CV contro 1,7 milioni di tutte le altre industrie.

Si obietta ancora che la attribuzione di una potenza di zero CV all'industria elettrica equivale praticamente ad escludere questa importante attività dal novero delle industrie con la conseguenza di rendere impossibile la determinazione della sua importanza (rispetto alle altre industrie e all'industria di un intero Stato nel suo complesso) con riferimento alla potenza utilizzabile. Per contro, quando si vuol determinare l'ordine di importanza dei diversi rami di industria in base a qualsiasi altro elemento caratteristico (addetti, mano d'opera, valore della produzione, ecc. e persino potenza dei motori primari, dei generatori elettrici, dei motori elettrici, considerati ciascuno a sè stante) l'industria elettrica viene sempre ed a giusto titolo considerata fra le industrie.

Le obiezioni e le incertezze — e i calcoli errati eseguiti in diversi Stati — traggono evidente origine dal non aver fissato chiaramente lo scopo del calcolo: la determinazione cioè della potenza installata per *azionare il macchinario*, per produrre cioè energia *meccanica* assorbita dal macchinario.

In relazione a questo particolare scopo l'industria elettrica assume il carattere di un *servizio* di distribuzione; di un'*attività economica ausiliaria* delle altre *industrie* — e, in generale di tutte le altre attività economiche: agricoltura, trasporti, commercio, servizi, aziende domestiche, ecc. — alle quali fornisce (vende) energia elettrica.

Ai fini della nostra valutazione si può immaginare che i motori primari installati presso le centrali elettriche siano installati nei singoli stabilimenti censiti (nei quali vengono idealmente frazionati) con i relativi generatori elettrici in misura corrispondente alla potenza assorbita dai motori elettrici (azionati dall'esterno) effettivamente installati negli stabilimenti stessi. L'industria elettrica viene cioè ad essere idealmente riassorbita da ciascun stabilimento. La conclusione indicata costituisce l'unica soluzione praticamente possibile per evitare gravi duplicazioni di dati e per ottenere quella congruenza del calcolo, cui abbiamo accennato alla fine del paragrafo 6 punto *C* (1). Sulla questione ritorneremo ancora.

L'evidenza della conclusione è palmare quando si riconsideri il caso 3°, di uno stabilimento *B* che aziona tutto il proprio macchinario con motori elettrici di 100 CV alimentati soltanto con energia elettrica fornitagli da uno stabilimento *A* (centrale elettrica) che abbia installato presso di sè un motore primario (una turbina idraulica, ad es.), ed un generatore di 100 CV. Per calcolare la potenza complessivamente utilizzabile *nei due* stabilimenti *A* e *B* *per azionare il macchinario* si debbono considerare o soltanto i 100 CV (del motore primario o del generatore) dello stabilimento *A* o soltanto i motori elettrici di 100 CV dello stabilimento *B* (alimentato dai motori primari dello stabilimento *A*): in questo secondo caso lo stabilimento *A* figura con potenza utilizzabile zero. Se si sommassero le due cifre si avrebbe una assurda duplicazione di potenza: la potenza originaria essendo sempre ed *unicamente* quella del motore idraulico (anzi, quella della caduta d'acqua che aziona la turbina idraulica).

c) *Diretta determinazione della potenza globale utilizzabile nello Stato, come dato a sè stante.* — Per determinare la potenza complessivamente installata nello Stato senza preoccuparsi della suddivisione tra

(1) La Svizzera « dopo deliberazione approfondita con l'Ufficio federale dell'economia elettrica » ha introdotto come si è più volte avvertito, una « modificazione fondamentale relativamente al modo di formulare il quesito relativo alla forza motrice, nel questionario » usato per il censimento delle fabbriche del 1937 decidendo di « lasciare completamente a parte, questa volta le *officine di elettricità*, con l'energia che esse producono, in considerazione che queste non utilizzano in proprio che una parte molto minima di questa forza motrice...». E si aggiunge « *l'energia che esse producono è stata così considerata come una specie di merce da esse trasmessa ai consumatori* » (cfr. *Statistique suisse des fabriques du* 16 *septembre* 1937. *Statistiques de la Suisse*, 84me fascicule. Bureau Fédéral de Statistique (Berne, 1940, Série Da 2, pag. 38*). Lo stesso criterio era, del resto, stato adottato nei censimenti del Regno Unito (cfr. ad es., *Final Report on the Fourth Census of Production of the United Kingdon* (1930). Part. V, *General Report*. London 1935, Cap. X, pag. 108-123.

i vari rami di industria o per circoscrizioni territoriali minori anzichè procedere al calcolo, più complicato di cui ai punti *a*) e *b*) del presente paragrafo, si può procedere in modo assai più spedito. Considerato che in conformità all'ipotesi preliminare è escluso qualsiasi impiego di energia elettrica per uso diverso dall'azionamento del macchinario, basterà, *sommare* la potenza di *tutti* e soltanto i *motori primari*, ovunque essi siano installati, *compresi quindi quelli dell'industria elettrica*. Non vi è in questo caso, nessun pericolo di doppi impieghi o di errori (1).

d) *Quadratura dei risultati.* — In base alle premesse fatte (cfr. paragr. 6, punto *C*), la potenza determinata in base al procedimento di cui al punto *b* deve coincidere con la potenza complessiva dello Stato determinata con il più semplice sistema di cui al punto precedente. Occorre, cioè, che la potenza complessiva di tutti i motori *primari* installati nello Stato (compresi quelli dell'industria elettrica) sia eguale alla somma delle potenze utilizzabili negli stabilimenti industriali (casi 1 a 7) calcolata secondo i tre criteri *A*, *B*, *C* a suo tempo indicati. Ciò che infatti risulta poichè, per limitarci al criterio *A*), la potenza di tutti i motori elettrici azionati dall'esterno (da aggiungere a quella dei motori primari), corrisponde appunto, *per l'insieme dello Stato*, alla potenza dei motori primari installati nell'industria elettrica (caso 8°) dai quali si è sviluppata l'energia per alimentare detti motori elettrici. Abbiamo infatti supposto, per ipotesi, che tutta l'energia prodotta dall'industria elettrica non serva che ad alimentare i motori elettrici dei vari stabilimenti industriali e che nessun altro stabilimento venda energia elettrica o ne consumi sotto altra forma (usi diretti).

Perchè sia rispettata la ovvia condizione che la somma delle potenze utilizzate nei singoli stabilimenti (o dei singoli rami d'industria) di uno Stato sia eguale alla potenza globale utilizzabile nell'intero Stato (comunque sia calcolata) l'*industria elettrica non può figurare tra i singoli stabilimenti o rami d'industria* (o deve figurarvi con una potenza di zero CV) come si è già dimostrato.

§ 9. - Primo adattamento alla realtà dell'ipotesi preliminare - L'energia elettrica venduta e passaggio dai kWh ai kW. — Le conclusioni precedenti sono vincolate al verificarsi, fra l'altro, della premessa fatta e cioè che gli stabilimenti industriali destinino tutta l'energia elettrica, eventualmente prodotta nello stabilimento (casi 2°, 5°, 6° e 7°), ad azionare il macchinario degli stabilimenti stessi, senza venderne alcunchè a terzi. La vendita di energia elettrica essendo stata ammessa soltanto per le industrie elettriche. In realtà nei quattro casi considerati gli stabilimenti possono vendere (o cedere) *parte* dell'energia prodotta (se la vendessero tutta si tratterebbe di una centrale elettrica) ad altri stabilimenti, i quali, si suppone la destinino tutta ad azionare motori elettrici dell'industria.

È evidente che la potenza utilizzabile deve essere diminuita della potenza corrispondente all'energia venduta. È, d'altronde, quanto si è già praticato, nel caso dell'industria elettrica.

Detta deduzione deve essere fatta però soltanto quando si segua per il calcolo il criterio *A*), che è appunto stato, indirettamente, seguito nel risolvere il caso 8° dell'industria elettrica (2).

Usando invece il criterio *B*) o il criterio *C*) non occorre fare alcuna deduzione poichè questi due sistemi considerano soltanto quella parte di potenza dei motori primari destinata ad azionare direttamente il macchinario (parte dei motori primari collegati meccanicamente al macchinario e tutti i motori elettrici): la potenza corrispondente all'energia eventualmente venduta venne, quindi, automaticamente, già estromessa dal calcolo.

All'energia venduta (casi 2°, 5°, 6°, 7°, 8°) deve corrispondere un'energia *acquistata* da parte dei diversi stabilimenti che, per ipotesi, essi impiegano *tutta* per azionare i motori elettrici (azionati dall'esterno) (casi 3°, 4°, 5°, 7°).

Quindi la *potenza corrispondente all'energia venduta complessivamente in uno Stato, corrisponde — nell'ipotesi preliminare considerata — alla potenza dei motori elettrici installati nello Stato ed azionati dall'esterno* (*con energia acquistata*).

* * *

Va richiamata l'attenzione sulla circostanza che *in pratica* la determinazione delle quantità di potenza (in kW) corrispondente all'eventuale quantità di energia *venduta* (in kWh) specialmente da parte degli stabilimenti industriali — per azionare il macchinario — urta con *gravi difficoltà di rilevazione*, cosicchè si finisce per lo più di non tenerne

(1) Salvo il caso di energia elettrica importata od esportata dallo Stato, che si esclude dall'ipotesi.

(2) L'applicazione dei due criteri *B*) e *C*) al caso 8° dell'industria elettrica conduce egualmente ad una potenza zero perchè col criterio *B*) non può esistere nessun motore, nè primario, nè elettrico, azionante il «macchinario», in quanto questo per ipotesi non esiste nella centrale; col criterio *C*) la potenza di tutti i motori primari diminuita della potenza dei generatori dà pure zero, e nulla è altresì la potenza dei motori elettrici che, essi pure per ipotesi, non esistono presso la centrale.

conto nel calcolo della potenza qualora si segua il criterio *A*).

Le difficoltà di rilevazione dipendono dal fatto che gli stabilimenti produttori e venditori di energia elettrica possono fornire facilmente soltanto il dato della quantità di energia venduta, in *kWh*, e non quello della potenza *corrispondente*, in kW.

In pratica si è cercato di girare la difficoltà chiedendo al censito oltre al dato relativo ai kWh venduti (o alle ore di erogazione) anche quello delle ore complessive di funzionamento dei generatori. Ma i dati oltre ad essere difficilmente fornibili dal censito in modo esatto, non permettono di risolvere razionalmente la questione.

Nei censimenti del 1937-40 (1) ad esempio, si chiese agli esercizi industriali che avevano installati generatori elettrici, oltre alla loro potenza, la quantità complessiva, in kWh, dell'energia venduta e il numero delle ore di erogazione (corrispondenti all'energia venduta).

Anche se il censimento 1937-40 avesse fornito un terzo dato (non richiesto nel questionario) sulle ore *complessive* di funzionamento del generatore per tutti gli scopi (cioè per produrre energia tanto destinata alla vendita, quanto ad usi interni dello stabilimento) i risultati che se ne potevano dedurre avrebbero presentato sempre il fianco a critiche fondate.

Si supponga che uno stabilimento con un generatore di 100 kW abbia venduto 292.000 kWh funzionando cioè, a tale scopo, per 2.920 ore nell'anno — cioè 8 ore al giorno — e che abbia complessivamente funzionato (nell'anno) per 5.840 ore (cioè per 16 ore in media al giorno) producendo 584.000 kwh. Per calcolare la potenza corrispondente all'energia venduta si potrebbe procedere in due modi :

1) attribuire all'energia venduta una corrispondente potenza di 50 kW (cioè metà della potenza installata), in quanto è stata destinata alla vendita soltanto metà dell'energia prodotta in complesso dal generatore (in generale, cioè, si dividerebbe la potenza del generatore in parti proporzionali alle ore di funzionamento dedicate a produrre energia elettrica rispettivamente per la vendita e per il consumo interno). I risultati a cui si giungerebbe in pratica sono criticabili in quanto, alla stessa quantità di energia venduta da due diversi stabilimenti può corrispondere una potenza diversa che sarebbe in funzione del diverso numero di ore di funzionamento dei generatori dei due stabilimenti, cioè a un elemento che non ha alcun rapporto con la potenza installata. Si faccia il caso di uno stabilimento che abbia installato un generatore di 50 kW e funzioni 16 ore al giorno ($^2/_3$ cioè delle ore disponibili) per vendere energia e 8 ore per produrre energia per usi interni. L'energia venduta sarà sempre di 292.000 kwh (16 ore x 50 kW x 365 giorni), ma la potenza corrispondente sarà di 33,3 kW (cioè $^2/_3$ della potenza installata).

2) attribuire all'energia venduta una potenza di 33,3 kW in quanto solo 1/3 della energia *teoricamente* producibile dal generatore venne destinata alla vendita (2.920 ore essendo 1/3 delle 8.760 ore complessive dell'anno cioè del tempo massimo per cui il generatore può funzionare). Anche questa soluzione è criticabile perchè in tal modo si farebbe corrispondere all'energia venduta (292.000 kWh) una potenza di 33,3 kW, mentre alla stessa quantità di energia prodotta per usi interni (292.000 kWh) si farebbe evidentemente corrispondere la residua potenza del generatore cioè 66, 6 kW, vale a dire una potenza doppia, ciò che è illogico.

Il primo modo di calcolo, malgrado la incongruenza rilevata è più aderente al concetto di « potenza » applicato ai nostri calcoli in quanto nel determinare la potenza si deve fare astrazione dal maggiore o minore lavoro effettivamente compiuto dal generatore, il quale deve figurare nella statistica per 100 kW tanto se abbia funzionato per un giorno o per cento giorni o per 365.

Per una centrale elettrica che vende tutta la sua energia lavorando per 2.920 ore nell'anno si farebbe corrispondere tutta la potenza installata, mentre col secondo modo di calcolo si farebbe corrispondere solo 1/3 della potenza lasciandone scoperti 2/3.

Tutto ciò a prescindere dall'inconveniente che deriva — come è la norma — dal considerare i generatori installati ad una data fissa (data del censimento) e, per contro, la potenza venduta nell'anno di censimento, nel corso del quale il numero e la potenza dei generatori installati può essersi modificata.

* * *

Queste considerazioni mettono in evidenza la *opportunità*, di *non seguire il criterio* A) quando, per il *primo scopo della nostra ricerca*, si debba calcolare la potenza per *singoli rami di attività*.

Quando, invece, ci si riferisce al *complesso dello Stato*, il *calcolo* — sempre nelle condizioni poste nell'ipotesi preliminare rettificata — *può essere*

(1) Nel censimento industriale del 1927 ci si accontentò di chiedere se tutta o parte dell'energia elettrica prodotta nell'esercizio fosse venduta a terzi (senza peraltro chiederne la quantità).

eseguito indirettamente — per il solo scopo primo — considerando tutta l'energia venduta in uno Stato (salvo le esportazioni) equivalente alla potenza di tutti i motori elettrici installati nello Stato stesso ed azionati dall'esterno (esclusi quelli azionati con energia importata dall'estero) come si è già detto precedentemente.

* * *

Conviene, a questo punto, esprimere in simboli le conclusioni a cui si è giunti.

Chiamiamo con:

P la potenza dei motori primari « fissi » installati (1) e con Pm quella dei motori primari destinati ad azionare *direttamente* il macchinario (1);

Pg quella dei motori primari destinati ad alimentare i generatori elettrici.

Si pone $P = Pm + Pg$.

G, la potenza di tutti i generatori elettrici installati (1).

Si pone $Pg = G$; $Pm = P - G$.

E, la potenza di tutti i motori elettrici installati (1) e con Ei la potenza dei motori elettrici azionati dall'interno Ee la potenza dei motori elettrici azionati dall'esterno.

Si pone $E = Ei + Ee$ ($Ee = E - Ei$; $Ei = E - Ee$).

V, la potenza corrispondente all'energia elettrica venduta.

Nel caso che gli stabilimenti che producono energia elettrica non ne vendano (o cedano) a terzi (casi 2°, 5°, 6°, 7°) è:

$G = Ei$ e anche: $G = E - Ee$; $Ee = E - G$; $G = E - Ee$. Nel caso invece in cui ne vendano (o cedano) una parte si avrà: $G = Ei + V$; e $V = G - Ei$; $Ei = G - V$; $Ee = E - (G - V)$.

M, la potenza complessiva utilizzabile per azionare il *macchinario*. Questa si calcola come è indicato nel seguente prospetto 2 (col. 11, 12, 13). Per

(1) In conformità all'ipotesi preliminare (che non considera i trasporti, di qualsiasi genere) resta esclusa la potenza dei motori *elettrici* « mobili » dei trasporti elettrici (oppure, la corrispondente potenza dei generatori « fissi » oppure dei corrispondenti motori primari « fissi » che li azionano). Si suppone cioè che detti trasporti non esistano (vedi poi la rettifica di tale ipotesi al punto *C* del § 10 per i trasporti elettrici, interni). La potenza dei motori elettrici « mobili » (azionati da generatori e motori primari « fissi ») dei trasporti elettrici saranno indicati nel corso dello studio con R e rispettivamente Ri e Re ($R = Ri + Re$) a seconda che siano azionati da elettricità prodotta all'interno dello stabilimento o acquistata all'esterno.

Prosp. 2. — CALCOLO DELLA POTENZA UTILIZZABILE PER AZIONARE IL MACCHINARIO (M), NELL'IPOTESI PRELIMINARE CON UN PRIMO ADATTAMENTO ALLA REALTÀ (Cfr. paragr. 8 e 9).

										$M_{,8} = P_{,8}$ (4)		

(1) La differenza fra p e g è zero.
(2) Industria produzione energia elettrica nell'ipotesi, premessa, che tutta la potenza disponibile delle centrali elettriche sia destinata esclusivamente ad azionare motori elettrici « fissi » di altri stabilimenti industriali e *solo* di questi.
(3) Si esclude, per ipotesi, che nelle centrali elettriche siano installati motori elettrici.
(4) Vedasi commento nel testo a pagina seguente.

l'intelligibilità di questo si avverte che le lettere minuscole (p; p_m; p_g; g; e; e_i; e_e; v; m) indicano i dati relativi al singolo caso e le lettere maiuscole le *somme* dei dati relativi. Così, mentre $P_{,7}$ indica la somma delle potenze dei motori primari dei casi da 1 a 7; $P_{,5}$ per i casi da 1 a 5 ecc., p_7 indica la potenza del motore primario del caso 7°, p_5 pel caso 5, ecc.

Deve essere dimostrato che il totale della potenza *complessivamente utilizzabile nello Stato per azionare il macchinario* ($M_{,8}$), calcolata con i tre criteri (A), (B), (C), deve essere eguale a $P_{,8}$.

Criterio (A). — Come si è detto, nell'*ipotesi preliminare considerata*, la potenza dei motori elettrici azionati dall'*esterno* installati in tutti gli stabilimenti industriali $Ee_{,7}$ deve essere eguale alla potenza corrispondente a tutta l'energia elettrica venduta dalle centrali elettriche (v_8) aumentata della potenza corrispondente all'eventuale energia elettrica venduta da stabilimenti industriali ($V_{,7}$) : è cioè $Ee_{,7} = V_{,7} + v_8$, da cui

(1) $$v_8 = Ee_{,7} - V_{,7}$$

Si osserva poi che $P_{,8} = P_{,7} + p_8$ ma poichè per ipotesi $p_8 = v_8$ è :

(2) $$P_{,8} = P_{,7} + v_8$$

Sostituendo nella (2) a v_8 il valore della (1) sopra trovato sarà appunto :

(3) $$P_{,8} = P_{,7} + Ee_{,7} - V_{,7} = M_{,8}$$

Criteri (B) *e* (C). — Tenendo conto delle varie eguaglianze premesse al prospetto e le precedenti è facile giungere allo stesso risultato :

Criterio (B). — Essendo, infatti, per ipotesi : $P = Pm + Pg$; $Pg = G$; $G = Ei + V$; sarà $P = Pm + Ei + V$, e cioè :

(4) $$P_{,7} = Pm_{,7} + Ei_{,7} + V_{,7}$$

Considerando la (1) e essendo per ipotesi $Ee_{,7} = E_{,7} - Ei_{,7}$, la (1) si può scrivere :

(5) $$v_8 = (E_{,7} - Ei_{,7}) - V_{,7}$$

Sostituendo nella (2) i valori della (4) e della (5) : $P_{,8} = (Pm_{,7} + Ei_{,7} + V_{,7}) + (E_{,7} - Ei_{,7} - V_{,7})$ da cui :

(6) $$P_8 = Pm_{,7} + E_{,7} = M_{,8}$$

Per il criterio (C) si ricade nel caso B, ricordando che $Pm = (P - G)$ cioè che $Pm_{,7} = (P_{,7} - G_{,7})$. Si ricava perciò dalla (6) :

(7) $$P_{,8} = (P_{,7} - G_{,7}) + E_{,7} = M_{,8}$$

Risulta quindi che :

$$\left.\begin{array}{ll} (8) & \text{Criterio } (A) : P_{,7} + Ee_{,7} - V_{,7} \\ (9) & \text{Criterio } (B) : Pm_{,7} + E_{,7} \\ (10) & \text{Criterio } (C) : (P_{,7} - G_{,7}) + E_{,7} \end{array}\right\} = P_{,8} = M_{,8}$$

§ 10 - Definitivo adattamento alla realtà dell'ipotesi preliminare. — Dobbiamo ora rendere aderente alla realtà tutte le altre condizioni che per comodità di esposizione, sono state indicate all'inizio del § 8 a pag. 25*.

A) *Il caso dell'industria elettrica - Formule generali.* — Innanzitutto va rettificata l'ipotesi che presso le centrali elettriche non esistano motori elettrici azionati dall'interno, caso in realtà abbastanza frequente, o dall'esterno (caso più raro). In realtà esistono spesso, presso le centrali elettriche, officine di riparazione, laboratori e simili presso le quali possono essere installati motori elettrici (e_{i8} e anche e_{e8}). Si tratta naturalmente di potenze modeste (1). Non si ammette per contro che esistano « macchinari », per lavoro industriale vero e proprio, azionati meccanicamente e direttamente dai motori primari (sarà cioè sempre Pm = zero).

L'indicazione di potenza « zero » per l'« industria elettrica » — indicata nella penultima riga « industria elettrica » del prospetto 2 (alle coll. 11, 12, 13) e conforme all'ipotesi preliminare — va rettificata come segue :

col. 11 criterio (A) $= p_8 + e_{e8} - v_8 = e_8$ (essendo $p_8 = v_8 + e_{i8}$)

col. 12 criterio (B) $= p_{m8} + e_8 = e_8$ (essendo p_{m8} = zero)

col. 13 criterio (C) $= (p_8 - g_8) + e_8 = e_8$ (essendo $p_8 - g_8$ = zero).

I totali per il « complesso dello Stato » (ultima riga del prospetto 2) restano così modificati :

col. 11 — Criterio (A) $= P_{,8} + Ee_{,8} - V_{,8}$

» 12 — » (B) $= Pm_{,8} + E_{,8}$

» 13 — » (C) $= (P_{,8} - G_{,8}) + E_{,8}$

Ciascuna delle tre formule è a sua volta eguale a $P_{,8}$ ($= M_{,8}$) (2). Infatti : col criterio (A), per il

(1) In Italia, ad es., circa 1.600 CV su 7.441.000 CV dei motori primari Sono escluse anche le potenze delle eccitatrici, trasformatori ecc. (Cfr. § 3 pag. 12*, § 7, pag. 25* e *allegato*).

(2) L'invariabilità dei valori delle tre formule — il cui valore resta, cioè eguale a $P_{,8}$ malgrado l'aggiunta di e_8 — si spiega tenendo presente che per il complesso dello Stato si tratta di una sommatoria di valori (relativi a ciascun ramo d'industria) per cui alla quantità aggiunta ($e_8 = e_{i8} + e_{e8}$) corrisponde nei termini delle formule stesse un corrispondente minor valore. Infatti nella formula di cui al criterio (A) all'aggiunta del valore e_{e8} corrisponde un maggior valore (in diminuzione) di $V_{,7}$, perchè altri stabilimenti

complesso dello Stato, $Ee_{,8}$ è eguale a $V_{,8}$ (all'energia elettrica venduta per azionare il macchinario, $V_{,8}$, corrisponde la potenza dei motori elettrici azionati dall'esterno); col criterio (B) essendo $Pm_{,8} = P_{,8} - Pg_{,8}$; $E_{,8} = Ei_{,8} + Ee_{,8}$, sostituendo si ha: $(P_{,8} - Pg_{,8}) + Ei_{,8} + Ee_{,8}$, ma $Pg_{,8}$ per il complesso dello Stato è eguale a $Ei_{,8} + V_{,8}$; sostituendo si ha: $(P_{,8} - Ei_{,8} + V_{,8}) + Ei_{,8} + Ee_{,8}$, cioè: $P_{,8} + Ee_{,8} - V_{,8}$ che corrisponde al valore trovato per il criterio (A) e quindi è eguale a $P_{,8}$. Così dicasi per il dato del criterio (C).

Si ricavano quindi le *formule generali*, applicabili — nell'*ipotesi preliminare considerata* — a qualsiasi caso, cioè a qualsiasi stabilimento (o ramo d'industria).

a) Per *ciascun stabilimento*, a sè stante:

(11) Criterio (A): $P + Ee - V$

(12) » (B): $Pm + E$

(13) » (C): $(P - G) + E$.

b) Per calcolare il totale della *potenza globalmente installata nello Stato, desumendola dalla somma dei dati di ciascun stabilimento* calcolati con una delle tre formule (11), (12), (13) le formule stesse restano invariate solo che vanno precedute dal segno di sommatoria:

Criterio (A) $= \Sigma P + \Sigma Ee - \Sigma V$

» (B) $= \Sigma Pm + \Sigma E$

» (C) $= \Sigma (P - G) + \Sigma E$

c) Il dato a sè stante della *potenza globalmente installata nello Stato determinato direttamente*, come dato a sè stante, è eguale a P:

(14) $$M = \Sigma P,$$

d) Per la necessità di *quadratura* dovrà, come abbiamo già dimostrato, essere sempre:

$$\left.\begin{array}{l} \Sigma P + \Sigma Ee - \Sigma V \ (1) \\ \Sigma Pm + \Sigma E \ (2) \\ \Sigma (P - G) + \Sigma E \ (2) \end{array}\right\} = \Sigma P = M$$

segue nota 1.

(nei casi da 2 a 7) debbono aver venduta una quantità di energia corrispondente appunto ad e_{e8}. Nella formula di cui al criterio (B) al valore in più e_8 corrisponde un minor valore, da una parte, di p_8, per la potenza e_{i8}, e ad un minor valore di e_{e8} corrisponde un minor valore di $Pm_{,7}$ (in quanto una equivalente parte dell'energia primaria degli stabilimenti industriali deve essere stata sottratta all'azionamento del macchinario per essere destinata ad azionare i motori elettrici e_{e8} dell'industria elettrica).

Per il criterio (C) vale quanto detto per le due formule precedenti.

(1) La potenza E_e, per il complesso dello Stato (ΣE_e) è eguale a ΣV e perciò $\Sigma E_e - \Sigma V =$ zero.

(2) Per il complesso dello Stato, tutta la potenza dei motori elettrici non può essere derivata, *nell'ipotesi considerata*, che da energia elettrica prodotta da generatori e cioè: $E = P_g = G$ e quindi $P_m + E = P_m + P_g = P$ oppure: $(P - G) + E = P - G + G = P$.

B) *Le destinazioni dell'energia elettrica venduta.* — Bisogna anche rettificare l'ipotesi che tutta l'energia elettrica vendibile (dalle industrie elettriche — caso 8° — e dagli stabilimenti industriali produttori di energia elettrica: casi 2°, 5°, 6° 7°) sia tutta e soltanto destinata ad azionare macchinari. Le quantità vendute possono, invece, avere in realtà le seguenti destinazioni negli stabilimenti acquirenti (3):

1) azionare macchinari pel tramite di motori elettrici « fissi »;

2) per usi diretti: illuminazione privata (di stabilimenti industriali, di case, ecc.) o pubblica; usi elettrotermici; usi elettrochimici;

3) per trazione elettrica pel tramite di motori elettrici « mobili » (dei trasporti elettrici).

Possiamo quindi considerare l'energia V composta delle tre suddette parti che chiamiamo rispettivamente Vm (per azionare macchinari) Vu (per usi diretti) Vr (per trasporti elettrici) sarà cioè

$$V = Vm + Vu + Vr$$

a) Per il calcolo relativo a *ciascun stabilimento* (od a ciascun ramo d'industria) non vi è da apportare nessuna modificazione alle tre formule (11) (12) (13) in quanto col criterio (A) la quantità V, in deduzione, comprende già le tre parti ora specificate e si potrà solo scrivere più precisamente:

(15) Criterio (A) $= P + Ee - (Vm + Vu + Vr)$.

Le altre due formule (12) e (13) non hanno bisogno di rettifiche poichè in esse non figura la energia venduta.

b) Per il calcolo relativo al *complesso dello Stato* (somma dei dati della potenza di ciascun stabilimento o ramo d'industria) valgono le formule precedenti nelle quali ciascun termine sia preceduto dal segno di sommatoria.

c) Per il calcolo relativo alla *determinazione diretta della potenza globale* utilizzabile *nello Stato*, come dato a sè stante, bisognerà dedurre dalla (14) il valore dell'energia venduta destinata a usi diretti e trazione elettrica sarà cioè:

(16) $$M = \Sigma P - \Sigma (Vu + Vr)$$

Il valore di questa formula corrisponde al valore della (15) riferito al complesso dello Stato — cioè: $\Sigma P + \Sigma Ee - \Sigma (Vm + Vu + Vr)$ — in quanto in tal caso vi è compensazione fra i valori di ΣVm e di ΣEe perchè la quantità complessivamente

(3) Le destinazioni potrebbero immaginarsi suddivise in maggior numero di parti. Ad esempio per la 2) si potrebbe distinguere l'illuminazione dagli usi termici, dall'elettrolisi, ecc.: si sono fatte solo tre distinzioni per non complicare troppo simboli e formule.

venduta nello Stato, per essere destinata ad azionare i macchinari, deve corrispondere — nell'ipotesi considerata — alla potenza dei motori elettrici azionati con energia acquistata dall'esterno; perciò la (15) riferita all'intero Stato si può scrivere così: $\Sigma P + (\Sigma Ee - \Sigma Vm) - \Sigma (Vu + Vr)$ e quindi:

$$\Sigma P - \Sigma (Vu + Vr)$$

d) Per la necessaria quadratura tra i valori di cui al punto *b*) e quello di cui al punto *c*) avremo:

$$\left.\begin{array}{ll} \text{Criterio } (A) & = \Sigma P + \Sigma Ee - \Sigma V \\ \text{»} \quad (B) & = \Sigma Pm + \Sigma E \quad (1) \\ \text{»} \quad (C) & = \Sigma (P - G) + \Sigma E \, (1) \end{array}\right\} = \Sigma P - \Sigma (Vu + Vr) = M$$

La gradita comodità di calcolare direttamente la potenza installata globalmente nello Stato (per azionare il macchinario) limitandosi a sommare la potenza dei soli motori primari — formula (14) — installati nello Stato (e quindi limitandosi a rilevare soltanto la potenza di queste) che si aveva nelle condizioni teoriche poste nell'originaria ipotesi preliminare del paragr. 8, non sussiste più. Occorre, invece, determinare anche i valori di Vu e di Vr.

Se questi fossero di scarsa entità, si potrebbero, in pratica trascurare, ma in Italia ad es. il valore di Vu corrisponde all'incirca al 40% della energia venduta dalle centrali elettriche e quindi a circa il 40% della loro potenza primaria installata che a sua volta corrisponde ad oltre l'80% della potenza primaria installata in tutto il Regno: ciò dipende dalla diffusione, relativamente recente, dell'impiego di energia elettrica per applicazioni elettrometallurgiche ed elettrochimiche che ne assorbono notevoli quantità. D'altra parte la determinazione di Vu e Vr per via indiretta o congetturale presenta difficoltà, come abbiamo già avuto occasione di rilevare (2).

C) *Destinazione dell'energia elettrica prodotta all'interno degli stabilimenti.* — Va rettificata anche l'ipotesi preliminare e cioè che tutta l'energia elettrica prodotta all'interno sia consumata all'interno dagli stessi stabilimenti produttori soltanto per azionare i macchinari (per mezzo dei motori elettrici con potenza e_i). Una parte può in realtà essere, anche, destinata (nei casi 2°, 5°, 6°, 7° e 8°) ad usi diretti (illuminazione, usi elettrotermici, ecc.) all'interno degli stessi stabilimenti produttori ed un'altra parte alla trazione elettrica all'interno degli stabilimenti. Chiamiamo queste potenze rispettivamente con Ui e Ri (entrambe comprese già nel valore di P o, più esattamente, nel valore di Pg o di G).

Per il calcolo della potenza *di ciascun stabilimento* si dovrà sottrarre il valore $(Ui + Ri)$, ma soltanto per la formula di cui al criterio (A) poichè solo in essa figura il valore di P (e quindi anche il valore di Ui e di Ri).

Per il criterio (B) la formula (12) resta invece invariata perchè essa non comprende il valore nè di P nè di Pg e quindi nemmeno di Ui e di Ri. Lo stesso può ripetersi per il criterio (C) (formula 13) in quanto $(P - Pg) = Pm$. Avremo quindi in definitiva:

a) Per la potenza di ciascun stabilimento in luogo delle formule (11) (12) (13):

(17) Criterio (A): $P + Ee - V - (Ui + Ri) = P + Ee - (V + Ui + Ri)$

(18) » (B): $Pm + E$

(19) » (C): $(P - G) + E$

b) Per *la potenza globalmente installata nello Stato ricavata dalla somma* dei dati di ciascun stabilimento valgono le stesse formule nelle quali a ciascun simbolo si faccia precedere a ciascun termine il *segno di sommatoria.*

c) Per *il dato globale dello Stato* determinato direttamente, come dato a sè stante, e riferito al complesso di tutti i rami di attività (economica o non) si dovrà egualmente dedurre dalla (16) il valore di $(Ui + Ri)$ sarà cioè: $M = \Sigma P - \Sigma (Vu + Vr) - \Sigma (Ui + Ri) = \Sigma P - \Sigma (Vu + Ui + Vr + Ri)$ ma per il complesso dello Stato la potenza venduta per usi diretti Vu corrisponderà alla potenza degli im-

(1) Per la formula di cui al criterio (A) si è già visto la sussistenza dell'eguaglianza. Che poi $\Sigma Pm + \Sigma E$ della formula di cui al criterio (B) sia esso pure uguale a $\Sigma P - \Sigma (Vu + Vr)$ è facile constatarlo in quanto $Pm = (P - Pg)$; ma: $Pg = Ei + V$; $E = Ei + Ee$; quindi $Pm + E = \{P - (Ei + V)\} + (Ei + Ee) = P - Ei - (Vm + Vu + Vr) + Ei + Ee$, ma già abbiamo detto che per il complesso dello Stato $\Sigma Vr = \Sigma Ee$: quindi sostituendo ed eliminando i termini eguali di segno opposto sarà: $Pm + E = P - (Vu + Vr)$. Lo stesso vale per (C).

(2) Disponendo di statistiche sul consumo di energia elettrica in kWh secondo le varie destinazioni si può calcolare congetturalmente e molto approssimativamente Vu_8. In Italia, ad esempio, nel 1938 su 13,3 miliardi di kWh venduti si consumarono per usi diretti e per trazione elettrica rispettivamente il 41,0% e 11,0% (cfr. prosp. 4, pag. 62*).

Supponendo che a tutta l'energia elettrica venduta dalle aziende elettriche corrisponda tutta la potenza installata presso le aziende stesse (e si commette un errore di valutazione lievemente in eccesso; perchè si trascura la potenza e_8: pari, nel 1938 a CV 1.577 su circa 7.500.000 CV di potenza primaria) si può dividere questa in parti proporzionali

segue nota 2.

alle due percentuali suddette (41,0 e 11,0). Per l'Italia si potrebbe quindi attribuire pel 1938 a Vu_8 il valore di CV 3.075.000 e a Vr_8 il valore di CV 825.000 (cfr. prosp. 5, pag. 62*).

Resterebbero però da determinare i valori di Vui e Vri per i quali non esistono statistiche che ne permettano il calcolo.

pianti che impiegano per tali usi energia elettrica d'acquisto cioè a Ue e così: $\Sigma Vu = \Sigma Ue$; analogamente la potenza venduta per la trazione elettrica corrisponderà alla potenza dei motori elettrici «mobili» (Re) alimentati da energia acquistata. Sarà cioè $\Sigma Vr = \Sigma Re$. Ricordando che $Ui + Ue = U$ e che $Ri + Re = R$ sarà:

$$M = \Sigma P - \Sigma (U + R) \tag{20}$$

Il valore della (20) corrisponde al valore della (17) riferito all'intero Stato — $\Sigma P = \Sigma Ee - \Sigma (V + Ui + Ri)$ — in quanto $V = Vm + Vu + Vr$. Tenendo presente che $\Sigma Vm = \Sigma Ee$; $\Sigma Vu = \Sigma Ue$; $\Sigma Vr = \Sigma Re$ e che $U = Ui + Ue$; sarà appunto: criterio $(A) = \Sigma P - \Sigma (U + R)$.

d) Per la quadratura fra i valori di cui al punto *b*) e quelli di cui al punto *c*) sarà:

$$\left.\begin{array}{ll} \text{Criterio } (A): \Sigma P + \Sigma Ee - \Sigma (V + Ui + Ri) & \\ \text{»} \quad (B): \Sigma Pm + \Sigma E & (1) \\ \text{»} \quad (C): \Sigma (P - G) + \Sigma E & (1) \end{array}\right\} \begin{array}{l} = \Sigma P - \\ - \Sigma (U + R) \\ = M \end{array}$$

§ 11. - Conclusioni definitive per il primo scopo. — *a*) La potenza utilizzabile in *ciascun stabilimento* (o in ciascun ramo d'industria o provincia o regione) e destinata esclusivamente ad azionare il macchinario (M) può essere determinata con una delle tre formule (17) (18) (19).

La *potenza utilizzabile globalmente in uno Stato* per azionare il macchinario può essere determinata nei due modi seguenti:

b) Sommando i valori ottenuti per ciascun stabilimento (o ramo d'industria) determinati secondo le stesse formule di cui al punto *a*) facendo precedere ciascun termine dal segno di sommatoria (con ciò il ramo «industria elettrica» figurerà solo con la potenza e_8).

c) Direttamente, come dato a sè stante, partendo dalla potenza complessiva di *tutti* i motori primari ovunque installati nello Stato (P) (compresi quelli dell'industria elettrica p_8) e deducendo da questa cifra la somma delle seguenti potenze, corrispondenti:

1) all'energia impiegata nello Stato per usi diretti (sia con energia prodotta all'interno degli stabilimenti che d'acquisto);

2) all'energia impiegata per la trazione elettrica (sia con energia prodotta all'interno degli stabilimenti che d'acquisto).

Si applicherà cioè la formula (20).

d) I valori di cui al punto *b*) debbono *quadrare* con il dato diretto di cui al punto *c*).

La determinazione dei valori di Ui e di Ue, cioè di U, urta spesso contro difficoltà non lievi come si è già detto più volte (cfr. anche paragr. 12 seguente).

(1) Per la quadratura della formula di cui al criterio (B) si tenga presente che $Pm = P - Pg$; che $Pg = Ei + Ui + Ri + V$ che $E = Ei + Ee$: quindi

$$Pm + E = \{P - (Ee + Ui + Ri + V)\} + (Ei + Ee)$$

considerato che:

$V = Vm + Vu + Vr$ e che il complesso dello Stato $\Sigma Vm = \Sigma Ee$ sarà:

$$\Sigma Pm + \Sigma E = \Sigma P - \Sigma (Ui + Ri + Vu + Vr) = \Sigma P - \Sigma (U + R)$$

Lo stesso dicasi per (C).

SECONDO SCOPO

POTENZA UTILIZZABILE PER QUALSIASI USO. ESCLUSI I TRASPORTI (ELETTRICI E NON ELETTRICI)

§ 12. - Potenza corrispondente al secondo scopo. (T). — La potenza differisce da quella calcolata per il primo scopo, di cui al paragrafo precedente, per l'aggiunta della potenza corrispondente all'energia impiegata per usi diretti e cioè per illuminazione, applicazioni termoelettriche, elettrochimiche, ecc.: sia con energia prodotta all'interno degli stabilimenti (i) sia con energia acquistata dall'esterno (e). La potenza corrispondente a questa energia è U; Ui per quella prodotta all'interno e Ue per quella acquistata: $U = Ui + Ue$. Questa è la potenza che si dovrà aggiungere alle formule di cui al primo scopo per calcolare la potenza di cui allo scopo in esame. Sarà cioè $T = M + U$.

Osserviamo, in via preliminare, che la determinazione per ciascun ramo d'industria della potenza ad esso relativa, che tenga conto anche della potenza corrispondente all'energia impiegata per detti usi diretti (U) è di grande rilievo per stabilire l'importanza relativa dei diversi rami d'industria rispetto alla potenza utilizzabile. Le industrie chimiche ed elettrosiderurgiche, ad esempio, grandi consumatrici di energia per elettrolisi e fusioni elettriche, dovrebbero infatti figurare con una potenza molto più elevata di quella che si usa normalmente attribuire loro col calcolo di cui allo scopo primo (potenza installata per azionare il macchinario).

Secondo calcoli congetturali, in Italia (1938)

le industrie chimiche, anzichè con una potenza utilizzabile di 490.000 CV — per lo scopo primo — dovrebbero figurare — per lo scopo secondo — con una potenza di circa 1.500.000 CV (più che triplicata); le industrie metallurgiche invece che con 790.000 CV figurerebbero con una potenza di circa 1.700.000 CV (più che duplicata). In tal modo le industrie chimiche dal quinto posto di importanza (con circa il 9% della potenza utilizzabile nel Regno) tenendo conto soltanto della potenza utilizzabile per azionare il macchinario (primo scopo) passerebbero al secondo posto (con il 20%). Le industrie siderurgiche dal terzo posto (col 13% della potenza installata nel Regno) passerebbero al primo posto (con circa il 23%). In Italia si calcolano 3,2 milioni CV (cfr. prosp. 7, pag. 67*).

Ciò premesso consideriamo i soliti quattro punti *a*) *b*) *c*) *d*):

a) Per il calcolo della *potenza di ciascun stabilimento* (o ramo di industria) occorrerà aggiungere alle formule corrispondenti ai tre criteri (*A*) (*B*) (*C*) di cui al paragrafo precedente, formule (17) (18) (19), il valore di $U\ (= Ui + Ue)$.

Si avrà :

Criterio (*A*) : $P + Ee - V - (Ui + Ri) + Ui + Ue$
$= P + Ee - (V + Ui + Ri) + Ui + Ue$

(21) $= P + (Ee + Ue) - (V + Ri)$ (1)

(22) Criterio (*B*) : $Pm + E + U$

(23) Criterio (*C*) : $(P - G) + E + U$

b) Per il calcolo della potenza *globalmente installata nello Stato ricavata dalla somma* dei dati di ciascuno stabilimento di cui al punto precedente valgono le stesse formule (21) (22) (23) precedute dal segno di sommatoria.

c) Per il *calcolo diretto, a sè stante della potenza globalmente installata nello Stato,* il valore di (*T*) è ricavabile dalla (20), aggiungendovi il valore di U :

(24) $T = \Sigma P - \Sigma (U + R) + \Sigma U = \Sigma P - \Sigma R$

Questo valore corrisponde a quello della (21) riferito all'intero Stato — cioè a: $\Sigma P + \Sigma (Ee + Ue) - \Sigma (V + Ri)$ — considerato che $V = Vm + Vu + Vr$ e che per il complesso dello Stato $\Sigma Vm = \Sigma Ee$, $\Sigma Vu = \Sigma Ue$, resterà, con le eliminazioni dei valori di segno contrario :

$\Sigma P - \Sigma (Vr + Ri)$, ma $\Sigma Vr = \Sigma Re$ ed : essendo $Re + Ri = R$ sarà anche: criterio (*A*): $\Sigma P - \Sigma R$.

d) Per la quadratura, come sempre facilmente controllabile, i valori di cui al punto *b*) corrisponderanno a quelli di cui al punto *c*), cioè : (1)

$$\left.\begin{array}{ll} \Sigma P + \Sigma (Ee + Ue) - \Sigma (V + Ri) & (2) \\ \Sigma Pm + \Sigma E + \Sigma U & (3) \\ \Sigma (P - G) + \Sigma E + \Sigma U & (3) \end{array}\right\} \begin{array}{l} = \Sigma P - \Sigma R \\ = T \end{array}$$

* * *

Come si è detto, in pratica la *determinazione* « *diretta* » *di U è praticamente molto difficile,* poichè si conoscono, tutt'al più, i dati relativi al *consumo* complessivo di energia elettrica (in chilowattore) e non i dati della *potenza* corrispondente a tale energia (in chilowatt) (cfr. § 9 pagg. 29* e 30*). Per rilevare i dati sul consumo dell'energia elettrica prodotta nell'interno dello stabilimento e destinata all'interno dello stabilimento stesso (*Ui*) occorrerebbe che lo stabilimento avesse installato — ed il caso è raro — un apposito contatore per l'energia da esso prodotta e consumata. Comunque, per calcolare il dato, in modo grossolanamente approssimativo, si dovrebbe dividere la potenza *complessiva* dei generatori installati in parti proporzionali ai consumi (kWh) di energia elettrica secondo la destinazione di questa. Occorrerebbe quindi chiedere al censito che produce energia elettrica : *a*) l'ammontare complessivo dei kWh prodotti per qualsiasi destinazione (interna o per la vendita) ; *b*) la percentuale approssimativa dei kWh consumati o impiegati per usi interni dello stabilimento, distintamente per i motori elettrici e usi diretti.

Per la determinazione per via indiretta cfr. paragrafo 21.

---

(1) Cfr. nota (2) nella colonna seguente.

(2) Se si trascura il valore di *Ri*, che in alcuni Stati può essere di importanza trascurabile, la formula $P + (Ee + Ue) - V$ può più semplicemente leggersi : potenza dei motori primari fissi installati (*P*) più potenza acquistata $(Ee + Ue)$ meno potenza venduta (V). Si ritorna cioè alla formula usata, in passato dalla Svizzera alla quale abbiamo già accennato al par. 4 punto *B* (cfr. anche nota (1) al par. 13, pag. 37*).

(3) La potenza complessiva dei generatori $(G = Pg)$ installati in uno Stato corrisponde a tutti i possibili impieghi di energia elettrica : $G = E + U + R$ ed essendo $P = Pm + Pg = Pm + G$, sarà $P = Pm + E + U + R$ cioè $Pm + E + U = P - R$, quindi anche:

$$\Sigma Pm + \Sigma E + \Sigma U = \Sigma P - \Sigma R.$$

TERZO SCOPO

POTENZA UTILIZZABILE PER QUALSIASI USO, COMPRESI TUTTI I TRASPORTI (ELETTRICI E NON ELETTRICI)

§ 13. - Potenza corrispondente al terzo scopo (C). Basterà aggiungere ai risultati relativi al secondo scopo (T): 1) la potenza destinata alla trazione elettrica (R); 2) la potenza dei motori primari (« mobili ») degli automezzi meccanici di trasporto (L), cioè $R + L$ ($= Z$: cfr. prosp. 1).

Sarà cioè $C = T + R + L = T + Z$.

Avremo quindi:

a) per i dati relativi alla potenza *installata in ciascun stabilimento* partendo dalle precedenti formule (21) (22) (23) ed aggiungendo $R + L$.

Criterio (A): $P + Ee - V - Ui - Ri + Ui + Ue + R + L$, ed essendo $R - Ri = Re$ sarà:

(25) Criterio (A): $P + Ee - V + Ue + Re + L = (P + L) + (Ee + Ue + Re) - V$ (1)

(26) Criterio (B): $Pm + E + U + R + L$

(27) Criterio (C): $(P - G) + E + U + R + L$

(1) Questa formula può leggersi come segue: potenza primaria installata ($P + L$) più potenza acquistata ($Ee + Ue + Re$) meno potenza venduta (V) ed è la formula usata in passato (prima del censimento del 1937) in Svizzera malgrado le difficoltà (da noi ritenute insuperabili) di determinare le potenze originarie corrispondenti all'energia acquistata (Ue e Re) e venduta V (cfr. par. 4, pag. 16* e seguenti).

La formula svizzera era espressa nel modo seguente:

$$M + e - v$$

dove M corrisponde alla potenza complessiva di tutti i motori *primari*, e alla potenza acquistata dall'esterno e v alla potenza venduta all'esterno. (Cfr. HUBER, lavori citati).

b) la *potenza installata globalmente nello Stato, dedotta dalla somma dei dati relativi a ciascun stabilimento di cui* alle tre formule (25) (26) (27) può calcolarsi secondo le stesse formule precedenti nelle quali ciascun membro è preceduto dal segno di sommatoria.

c) per il calcolo diretto *globale, a sè stante, della potenza installata nello Stato* partendo dalla formula (24) dello scopo secondo avremo:

(28) $\Sigma P - \Sigma R + \Sigma R + \Sigma L = \Sigma P + \Sigma L$

Qui si ha un altro esempio di calcolo diretto di maggiore semplicità e comodità.

Il valore della (28), come al solito, corrisponde a quello della (25) riferita all'intero Stato, $\Sigma (P + L) + \Sigma (Ee + Ue + Re) - \Sigma V$, in quanto $\Sigma V = \Sigma Ee + \Sigma Ue + \Sigma Re$ cioè:

$$\text{criterio } (A) = \Sigma P + \Sigma L.$$

d) la *quadratura* per il complesso dello Stato fra i valori di cui al punto *b*) e al punto *c*), facilmente constatabile (2), resta sempre:

$$\left.\begin{array}{l} \Sigma (P + L) + \Sigma (Ee + Ue + Re) - \Sigma V \\ \Sigma Pm + \Sigma E + \Sigma U + \Sigma R + \Sigma L \quad (2) \\ \Sigma (P - G) + \Sigma E + \Sigma U + \Sigma R + \Sigma L \ (2) \end{array}\right\} = \Sigma P + \Sigma L = C$$

(2) Per il criterio (B), infatti ($E + U + R$) per l'intero Stato, è costituita sempre dalla potenza corrispondente all'energia elettrica prodotta dai generatori (all'interno o all'esterno degli stabilimenti) e cioè $E + U + R = Pg = G$; cioè $Pm + E + U + R + L = Pm + Pg + L = P + L$. Così dicasi per il criterio (C).

QUARTO SCOPO

POTENZA UTILIZZABILE PER QUALSIASI USO E PER I TRASPORTI ELETTRICI (ESCLUSI I TRASPORTI NON ELETTRICI)

§ 14 - Potenza corrispondente al quarto scopo (F). — Come risulta dal prospetto 1, $F = T + R = M + U + R$. Per il calcolo basterà togliere dalle formule del paragrafo precedente la potenza dei motori primari « mobili » L. Si avrà quindi:

a) Per *la potenza installata in ciascun stabilimento* (o per singoli rami d'industria) dalle formule (25) (26) (27) avremo:

(29) Criterio (A): $P + (Ee + Ue + Re) - V$

(30) » (B): $Pm + E + U + R$

(31) » (C): $(P - G) + E + U + R$

b) Per *la potenza globalmente installata nello Stato*, dedotta dalla somma dei dati relativi a ciascun stabilimento di cui al punto *a*) precedente, valgono le stesse formule (29) (30) (31) precedute dal segno di sommatoria.

c) Per il *calcolo diretto, a sè stante, della potenza globale installata nello Stato* dalla (28) si ricava:

(32) $F = \Sigma P$

E, infatti, la potenza di tutti i motori primari « fissi » (P) corrisponde in uno Stato alla potenza destinata a qualsiasi uso e alla trazione elettrica, esclusione fatta dei trasporti non elettrici. Si ha cioè la *formula più semplice e più comoda* di calcolo.

Il valore della (32) come al solito corrisponde a quello della (29), riferito all'intero Stato:

$$\Sigma P + \Sigma (Ee + Ue + Re) - \Sigma V$$

in quanto per l'intero Stato:

$$\Sigma V = \Sigma (Ee + Ue + Re).$$

d) La *quadratura* fra i dati di cui al punto *b*) e al punto *c*) è, come sempre facilmente constatabile:

$$\left.\begin{array}{l} \Sigma P + \Sigma (Ee + Ue + Re) - \Sigma V \\ \Sigma Pm + \Sigma E + \Sigma U + \Sigma R \text{ (1)} \\ \Sigma (P - G) + \Sigma E + \Sigma U + \Sigma R \end{array}\right\} = \Sigma P = F$$

(1) Come si è detto nella nota (2) a pag. precedente $\Sigma (E + U + R)$ non è che la potenza dei generatori elettrici installati $\Sigma G = \Sigma Pg$ ma essendo $Pm + Pg = P$ sarà $\Sigma Pm + \Sigma (E + U + R) = \Sigma P$.

QUINTO SCOPO

POTENZA UTILIZZABILE PER L'AZIONAMENTO DEL MACCHINARIO E PER I TRASPORTI ELETTRICI (ESCLUSI GLI USI DIRETTI E I TRASPORTI NON ELETTRICI)

§ 15. - Potenza corrispondente al quinto scopo (O). — Come risulta dal prosp. 1: $O = M + R = F - U$. Si tratta della potenza che viene impiegata avvalendosi sempre e soltanto, come intermediario, del « motore elettrico », sia questo « fisso » sia « mobile », cioè accoppiato al veicolo elettrico.

Per il calcolo si dovrà partire dalla potenza determinata per il primo scopo ed aggiungere la potenza R corrispondente all'energia elettrica impiegata per i motori elettrici, oppure togliere dalle formule del paragrafo precedente (scopo quarto) il valore di U. Avremo quindi:

a) Per *la potenza installata in ciascun stabilimento:*

Criterio (A): $P + (Ee + Ue + Re) - V - U$ ma $U = Ui + Ue$ sarà quindi:

(33) formula $A = P + (Ee + Re) - (V + Ui)$

(34) Criterio (B): $Pm + E + R$

(35) Criterio (C): $(P - G) + E + R$

b) Per *la potenza globalmente installata nello Stato, dedotta dalla somma dei dati relativi a ciascun stabilimento,* cioè dalla somma delle formule (33) (34) (35), avremo le stesse formule precedute dal segno di sommatoria.

c) Per *il calcolo diretto, a sè stante, della potenza globale installata nello Stato* dalla (32) ricaviamo:

(36) $$O = \Sigma P - \Sigma U$$

Questo valore, come al solito, corrisponde a quello della (33) riferita all'intero Stato — $\Sigma P + \Sigma (Ee + Re) - \Sigma (V + Ui)$ — in quanto $\Sigma V = \Sigma Ee + \Sigma Re + \Sigma Ue$ e $\Sigma Ue + \Sigma Ui = \Sigma U$ e quindi: criterio $(A) = \Sigma P - \Sigma U$

d) Come sempre sussisterà la quadratura:

$$\left.\begin{array}{l} \Sigma P + \Sigma (Ee + Re) - \Sigma (V + Ui) \\ \Sigma Pm + \Sigma E + \Sigma R \text{ (1)} \\ \Sigma (P - G) + \Sigma E + \Sigma R \text{ (1)} \end{array}\right\} = \Sigma P - \Sigma U = O$$

(1) Considerato che $\Sigma Pg = \Sigma E + \Sigma R + \Sigma U$ sarà $\Sigma E + \Sigma R = \Sigma Pg - \Sigma U$ e quindi sostituendo nella formula: $\Sigma Pm + \Sigma E + \Sigma R$ l'equivalente dei valori $\Sigma E + \Sigma R$, avremo: $\Sigma Pm + (\Sigma Pg - \Sigma U)$ ma $\Sigma Pm + \Sigma Pg = \Sigma P$ quindi $\Sigma Pm + \Sigma E + \Sigma R = \Sigma P - \Sigma U$

§ 16. - Riepilogo e campo di applicazione pratica delle formule. — A) *Prospetto riepilogativo e dimostrativo.* — Data la frequenza con cui circola il dato della potenza *globale disponibile nello Stato,* ottenuto direttamente sommando la sola potenza dei motori primari (ΣP) — frequenza dovuta essenzialmente alla maggiore semplicità del suo calcolo — conviene riepilogare i calcoli della potenza globale dello Stato, *in ogni ramo di attività economica, partendo dal valore P:*

ΣP: Potenza destinata a qualsiasi uso ed ai trasporti elettrici (esclusi i trasporti non elettrici): (*scopo quarto*: formula 32).

$\Sigma P - \Sigma U$: Potenza destinata all'azionamento del macchinario ed ai trasporti elettrici (*scopo quinto:* formula 36).

$\Sigma P - \Sigma R$: Potenza destinata a qualsiasi uso, ma esclusi i trasporti elettrici (*scopo secondo:* formula 24)

$\Sigma P - \Sigma (U + R)$: Potenza destinata esclusivamente ad azionare il macchinario (*scopo primo*: formula 20)

$\Sigma P + \Sigma L$: Potenza destinata a qualsiasi uso, compresi i trasporti (elettrici e non) (*scopo terzo:* formula 28)

Vedendo altresì riepilogare, i dati sulla *potenza disponibile per ogni singolo stabilimento, partendo dalla potenza dei motori primari* P; e considerando le formule corrispondenti ai criteri (A) e (C), (ma trascurando (B) dato che $Pm = P - G$), avremo:

1° scopo

$(A): P - \{(V + Ui + Ri) - Ee\}$ (formula 17)
$(C): P - \{(G - E)\}$ (» 19)

2° scopo

$(A): P - \{(Ri + V) - (Ee + Ue)\}$ (» 21)
$(B): P - \{(G = (E + U)\}$ (» 23)

3° scopo

$(A): P - \{V - (Ee + Ue + Re + L)\}$ (» 25)
$(C): P - \{G = (E + U + R + L)\}$ (» 27)

4° scopo

$(A): P - \{V - (E(Ee + Ue + Re)\}$ (» 29)
$(C): P - \{G - (E + U + R)\}$ (» 31)

5° scopo

$(A): P - \{(V + Ui) - (Ee + Re)\}$ (» 33)
$(C): P - \{G - (E + R)\}$ (» 35)

Si riassume in un quadro sinottico e dimostrativo (prosp. 3 a pagina seguente) quanto è stato osservato nel corso del lavoro riferendoci ad alcuni dei più importanti casi tipici.

B) *Campo di applicazione pratica delle formule.* — Nel determinare, ai paragrafi 11, 12, 13, 14, 15, le formule generali abbiamo tenute ben distinte — nel l'apposito capoverso *c*) di ciascuno di detti paragrafi — le formule relative alla determinazione diretta, in un'unica cifra, a sè stante, della potenza globalmente utilizzabile per l'intero Stato e per *tutte* le attività (industriali o non)nelle quali siano installati «motori primari (fissi o mobili) generatori elettrici, motori elettrici (fissi o mobili): formule 20, 24, 28, 32, 36.

Il campo di applicazione pratica di queste formule è quindi non solo limitato all'intero Stato ma si richiede la disponibilità di dati totalitari — estesi a tutte le attività, comprese le aziende domestiche — quasi sempre difficilmente ottenibili.

Le altre formule, invece, sono applicabili, senza possibilità di errori od equivoci, tanto al singolo stabilimento quanto a separati rami di attività economica (e ai loro diversi aggruppamenti) quanto a circoscrizioni territoriali ristrette: comuni, province, regioni, ecc.: in ognuna di queste formule l'industria elettrica figura sempre con una potenza zero o con cifre modeste (malgrado la cospicua potenza «installata» dei motori primari).

Se non si dispone di *tutti* i dati occorrenti, le formule 20, 24, 28, 32, 36, non possono essere usate in pratica sotto pena, di errori — talora gravi — di potenza o di attribuire ai risultati un significato od una portata che essi non hanno.

Poichè in pratica un censimento veramente totalitario — esteso persino alle aziende domestiche, alle case di abitazione (per ascensori e simili) e, per lo scopo terzo, agli automezzi di trasporto privati — è raramente effettuabile, così le formule suddette hanno un campo assai ristretto di applicabilità. Se, ad es., in base ai dati ricavati di un censimento industriale, esteso a tutte le aziende artigiane e alle imprese produttrici di energia elettrica, ma esclusi i trasporti, si applicasse la formula 32 (ΣP: potenza utilizzabile nell'intero Stato dalle industrie censite) si commetterebbe: *a*) un errore notevole in eccesso, in quanto si comprenderebbe anche una gran parte della potenza «utilizzabile» da tutti i rami di attività *non* industriali che «utilizzano» a distanza, l'energia elettrica prodotta dai motori primari «installati», nelle imprese di produzione di energia elettrica. Si comprenderebbe, ad es., anche tutta la potenza «utilizzabile» delle imprese di trasporti con trazione elettrica; la potenza corrispondente all'energia utilizzabile per illuminazione delle case private o per uso pubblico, ecc.; *b*) un errore minimo in difetto, in quanto non si comprenderebbe la potenza «utilizzabile» da stabilimenti industriali per mezzo di motori elettrici (o installazioni dirette consumatrici) per illuminazione ecc. alimentati da energia elettrica acquistata da imprese non comprese nelle industrie elettriche (ad es. da imprese di trazione elettrica) che vendano una parte dell'energia elettrica prodotta.

Peraltro, quando le attività *non* industriali si valessero in grande prevalenza di energia elettrica di acquisto prodotta da industrie elettriche — come è il caso in Italia — un censimento industriale esteso alle imprese di produzione di energia elettrica e ai trasporti potrebbe fornire un dato globale non molto inferiore a ΣP (*scopo quarto*), relativo cioè all'intero Stato e a tutti i rami di attività (compresi le attività non industriali escluse dal censimento).

Se, per contro, il censimento ipotizzato non fosse esteso alle industrie elettriche, si commetterebbe, evidentemente, un gravissimo errore in difetto (cfr. paragr. 17 pag. 45*).

Gravi errori si commetterebbero applicando le formule suddette, valide solo per l'intero Stato, a circoscrizioni territoriali minori: comuni, provincie, regioni, ecc. Questa possibilità di errore o di equivoci si è constatata quando, ad es., si è inteso fare una graduatoria d'importanza delle provincie, in

Prospetto 3. — Quadro sinottico sul calcolo della potenza teoricamente utilizzabile.

Motori primari	Impiego:	Natura dell'energia prodotta e, o, impiegata	Luogo del consumo finale	Destinazione finale	Potenza corrispondente a stabilimenti: 1. (1) A rigore si dovrebbe considerare un valore Li per i trasporti all'interno dello stabilimento e Le per i trasporti esterni, ma data la particolare natura del dato, non sembra il caso.

Calcolo della potenza utilizzabile (1):

A) Formule generali.

I) NEL SINGOLO STABILIMENTO

Il secondo e terzo membro dell'eguaglianza stampati in carattere chiaro sono ricavati dalla applicazione del criterio (A), *partendo dal valore di* P; il membro stampato in neretto corsivo — e corrispondente allo stesso criterio seguito per indicare i totali di cui alle colonne 7, 9, 10, 12, 14 — è ricavato dalla applicazione (2) del criterio (B); l'ultimo membro, stampato in carattere *corsivo chiaro*, dal criterio (C).

1°) Per azionare esclusivamente il macchinario (*primo scopo*):

$$\mathbf{M} = \{P - (Ui + Ri + V)\} + Ee = \{Pm + Ei\} + Ee = \boldsymbol{Pm} + \boldsymbol{E} = (P - G) + E$$

(formule 17-18-19)

2°) Per qualsiasi uso, esclusi i trasporti (*secondo scopo*):

$$\mathbf{T} = \{P - (Ri + V)\} + (Ee + Ue) = \{Pm + Ei + Ui\} + (Ee + Ue) = \boldsymbol{Pm} + \boldsymbol{E} + \boldsymbol{U} = (P - G) + E + U$$

(formule 21-22-23)

3°) Per qualsiasi uso, compresi i trasporti (*terzo scopo*):

$$\mathbf{C} = \{P - V\} + (Ee + Ue + Re) + L = \{Pm + (Ei + Ui + Ri)\} + (Ee + Ue + Re) + L = \boldsymbol{Pm} + \boldsymbol{E} + \boldsymbol{U} + \boldsymbol{R} + \boldsymbol{L} = (P - G) + E + U + R + L$$

(formule 25-26-27)

4°) Per qualsiasi uso, esclusi i trasporti non elettrici (*quarto scopo*):

$$\mathbf{F} = \{P - V\} + (Ee + Ue + Re) = \{Pm + (Ei + Ui + Ri)\} + (Ee + Ue + Re) = \boldsymbol{Pm} + \boldsymbol{E} + \boldsymbol{U} + \boldsymbol{R} = (P - G) + E + U + R$$

(formule 29-30-31)

5°) Per azionare il macchinario ed i trasporti elettrici (*quinto scopo*):

$$\mathbf{O} = \{P - (Ui + V)\} + (Ee + Re) = \{Pm + (Ei + Ri)\} + (Ee + Re) = \boldsymbol{Pm} + \boldsymbol{E} + \boldsymbol{R} = (P - G) + E + R$$

(formule 33-34-35)

II) NELLO STATO, GLOBALMENTE

Il secondo membro dell'uguaglianza, stampata in neretto corsivo, è ricavato partendo dal valore di P; il terzo è ricavato dalla somma dei dati sopraindicati relativi al singolo stabilimento (calcolati con la formula di cui al criterio (B)):

1°) $\mathbf{M} = \Sigma \boldsymbol{P} - \Sigma (\boldsymbol{U} + \boldsymbol{R}) = \Sigma Pm + \Sigma E$
(primo scopo: formula 20)

2°) $\mathbf{T} = \Sigma \boldsymbol{P} - \Sigma \boldsymbol{R} = \Sigma Pm + \Sigma E + \Sigma U$
(secondo scopo: formula 24)

3°) $\mathbf{C} = \Sigma \boldsymbol{P} + \Sigma \boldsymbol{L} = \Sigma Pm + \Sigma E + \Sigma U + \Sigma R + \Sigma L$
(terzo scopo: formula 28)

4°) $\mathbf{F} = \Sigma \boldsymbol{P} = \Sigma Pm + \Sigma E + \Sigma U + \Sigma R$
(quarto scopo: formula 32)

5°) $\mathbf{O} = \Sigma \boldsymbol{P} - \Sigma \boldsymbol{U} = \Sigma Pm + \Sigma E + \Sigma R$
(quinto scopo: formula 36)

B) Totali per ciascun stabilimento e per ciascun scopo

	1. Produttori e venditori — Installata	1. utilizzabile all'interno	1. venduta	2. Acquirenti di energia — installata e utilizzabile all'interno	3. Produttori e acquirenti — installata e utilizzabile all'interno	4. Produttori, venditori e acquirenti — Installata	4. utilizzabile all'interno	4. venduta	5. Soltanto produttori — installata e utilizzabile all'interno
Primo scopo	—	$Pm+Ei$	—	Ee	$Pm+(Ei+Ee)$	—	$Pm+(Ei+Ee)$	—	$Pm+Ei$
Secondo scopo	—	$Pm+(Ei+Ui)$	—	$(Ee+Ue)$	$Pm+(Ei+Ui)+(Ee+Ue)$	—	$Pm+(Ei+Ui)+(Ee+Ue)$	—	$Pm+(Ei+Ui)$
Terzo scopo	—	$Pm+(Ei+Ui+Ri)+L$	—	$(Ee+Ue+Re)+L$	$Pm+(Ei+Ui+Ri)+(Ee+Ue+Re)+L$	—	$Pm+(Ei+Ui+Ri)+(Ee+Ue+Re)+L$	—	$Pm+(Ei+Ui+Ri)+L$
Quarto scopo	—	$Pm+(Ei+Ui+Ri)$	—	$(Ee+Ue+Re)$	$Pm+(Ei+Ui+Ri)+(Ee+Ue+Re)$	—	$Pm+(Ei+Ui+Ri)+(Ee+Ue+Re)$	—	$Pm+(Ei+Ui+Ri)$
Quinto scopo	—	$Pm+(Ei+Ri)$	—	$(Ee+Re)$	$Pm+(Ei+Ri)+(Ee+Re)$	—	$Pm+(Ei+Ri)+(Ee+Re)$	—	$Pm+(Ei+Ri)$

NOTE

(1) Tutti i dati, ad eccezione di P e di Pm, riguardano potenze corrispondenti ad energia elettrica fornita da generatori elettrici (installati all'interno o all'esterno dello stabilimento).

(2) Il passaggio dal secondo al terzo membro si ottiene sostituendo al valore di P l'equivalente $Pm + G$ dove $G = Ei + Ui + Ri + V$ e quindi $P = Pm + Ei + Ui + Ri + V$.

Si tenga inoltre presente che:

$$E = Ei + Ee; \quad R = Ri + Re; \quad U = Ui + Ue$$

base alla potenza. Applicando, infatti, le formule suddette (20, 24, 28, 32, 36) le province d'alta montagna con potenti installazioni di motori primari idraulici delle centrali elettriche si portano in testa alla graduatoria, pur non avendo spesso alcuna importanza nè industriale nè demografica. Per converso applicando le altre formule si urta spesso contro resistenze di alcune di dette province interessate che, vantando cospicue «installazioni» di motori primari, male si adattano a vedersi confinate in coda alla graduatoria (non «utilizzando» esse sul posto che una minima parte dell'energia prodotta e trasmessa a distanza, fuori provincia).

La confusione fra il concetto di potenza «installata» e di potenza «utilizzabile» — che riduce praticamente a zero l'importanza delle industrie elettriche — può, come nel caso semplificato, avere conseguenze pratiche di portata non trascurabile.

Gli è che per studi del genere è opportuno o ricorrere ad elementi diversi dalla potenza o fissare altri scopi, evitando, sopratutto, che questi abbiano ad interferire sui concetti generali che traggono la loro ragion d'essere da considerazioni e scopi diversi.

* * *

Un'altra cautela da osservare nell'applicazione delle formule generali indicate nei paragrafi precedenti è di evitare che si giunga ad un dato relativo all'intero Stato, sommando potenze calcolate per alcune branche di attività con formule relative ad uno scopo e, per altre branche, con formule riguardanti altri scopi. Ciò si può verificare talvolta in quanto alcune formule si ritengono, a torto o a ragione, più significative perchè più aderenti alle caratteristiche strutturali o alle finalità delle *particolari* branche considerate.

Tale è il caso, ad esempio delle imprese di trasporto, per le quali, *considerate di per sè stesse*, è indubbiamente più significativo il dato di cui allo scopo terzo che non quello di cui allo scopo primo, mentre quest'ultimo è più significativo per le industrie vere e proprie. Per confronti *limitati alle singole imprese di trasporto*, sarebbe anzi assai più significativo il calcolo della sola potenza utilizzabile degli automezzi di trasporto $(\Sigma R + \Sigma L)$: scopo settimo, cfr. pag. 21* (1)

Nell'ambito delle singole branche di attività — *considerate a sè stanti* — si possono usare le formule relative all'uno o all'altro scopo alla condizione di precisare esattamente lo scopo stesso e di evitare, comunque, di sommare dati ricavati dall'applicazione di formule relative a scopi diversi (1).

Circa le grandi classi caratteristiche delle diverse branche di attività si rinvia alle note fatte in calce al prospetto 1 a pag. 22*. Si rinvia inoltre al paragr. 20 per le osservazioni circa l'aderenza alla realtà dei risultati ottenuti dall'applicazione delle formule.

§ 17. - Alcuni esempi di errori o di incerte interpretazioni dei risultati. — La mancata osservanza dei criteri di calcolo indicati nelle conclusioni dei precedenti paragrafi ha provocato talvolta errori veri e propri o inesattezze oppure ha dato luogo a incerte interpretazioni dei risultati ottenuti. Ciò si spiega — come è stato molto efficacemente messo in luce da M. HUBER (2) — tenendo, fra l'altro, presente che in questi ultimi 50 anni la materia esaminata ha subìto cambiamenti profondi. Soprattutto a seguito della trasmissione a distanza dell'energia elettrica su vasta scala si è reso necessario introdurre nei calcoli nuovi elementi importanti un tempo inesistenti o praticamente trascurabili. Si consideri l'estensione crescente del motore elettrico, della trazione elettrica dell'impiego cospicuo dell'elettricità per usi termici, elettrometallurgici, elettrochimici e per illuminazione. Oggi nessun elemento può essere trascurato nel calcolo (cfr. paragr. 2), soprattutto quando si intendono fissare, come abbiamo inteso fare con il presente studio, delle norme generali.

Ciò va detto preliminarmente perchè i pochi esempi che si citeranno — tratti soltanto da una modesta parte del materiale statistico più a portata di mano (3) —

(1) Accade talvolta di imbattersi in errori nel calcolo della potenza delle imprese di trasporti per il desiderio di conteggiare in questa branca anche la potenza dei motori mobili (tutti o in parte) esclusi dal calcolo delle altre branche di attività, ma ritenuti come espressivi e significativi nei «trasporti» confondendo così calcoli aventi scopi diversi (cfr. par. 24 sui trasporti). A questo riguardo va segnalato un errore parziale commesso nel censimento italiano del 1927 conteggiando come potenza installata nell'«industria» dei trasporti (e solo per questo ramo d'industria) una parte della potenza delle locomotive a vapore. Per effetto di tale errore la potenza dei motori *primari* attribuita all'«industria» dei trasporti (e comunicazioni) ufficialmente indicata in 471.592 CV si riduce a circa 145.000 CV (diminuzione di circa il 70 %) e la potenza complessivamente installata nei trasporti $(Pm + E)$ passa da 398.000 a 156.000 CV (cfr. G. MORTARA, W. MUNGIOLI, E. OTTOLENGHI, *La meccanizzazione e l'elettrificazione dell'industria italiana* in «Nel cinquantenario della Società Edison (1884-1934)», Milano 1934-XII, pagg. 445-449-453-458, Vol. II).

(2) Cfr. nota (1) a pag. 1*.

(3) Per questo ci si è riferiti sopratutto al materiale statistico dei censimenti industriali italiani più recenti e a quello di pochi altri Stati. Un esame critico più completo delle statistiche di numerosi Stati — come venne compiuto da M. HUBER nel volume citato «*Statistique des forces motrices en* 1926» — gioverebbe indubbiamente ad approfondire la questione ma richiederebbe l'esame attento delle fonti prime dei dati (questionari di rilevazione e istru-

hanno esclusivamente lo scopo di mettere in rilievo l'importanza pratica delle conclusioni precedenti e non quello di rivolgere, nemmeno indirettamente, delle critiche a statistici e studiosi che nei diversi Stati hanno atteso in passato ai particolari censimenti o rilevazioni — sempre enormemente complessi — o alla illustrazione dei risultati.

1) *Duplicazioni nei parziali e nelle totalizzazioni.* — Esempi di questo tipo di duplicazioni si riscontrano nelle statistiche più antiche, quando era ai primordi la trasmissione a distanza dell'energia elettrica e la trazione elettrica. Esempi più recenti di duplicazioni si riscontrano anche, ad esempio, nel censimento industriale italiano del 1927 (1) nel quale non vi è traccia del calcolo della potenza utilizzabile nelle tavole statistiche dei volumi contenenti i risultati grezzi. Soltanto nel testo della relazione illustrativa (1) si prende in considerazione quella che viene chiamata semplicemente « potenza in HP » o « potenza complessiva » o « forza *motrice* sviluppata » o « HP sviluppati » o « HP in totale » e simili senza precisare peraltro il significato del dato pubblicato. Detta « potenza » è stata calcolata aggiungendo, per ogni classe d'industria considerata, alla potenza dei motori primari quella dei motori secondari, (2) commettendo così uno degli errori più evidenti in materia. Il metodo errato è stato applicato sia ai dati parziali (rami d'industria o di attività economica) sia, conseguentemente, alla totalizzazione. Risultano così affetti da errori tutti i dati assoluti, percentuali ed i coefficienti (HP per esercizio, HP per addetto, ecc.), ricavati sempre da detta potenza, contenente le duplicazioni accennate. Le conseguenze dell'errore diventano importanti soprattutto per l'industria elettrica nella quale è compresa la potenza di tutti i motori primari e per il totale del Regno. Per gli altri singoli rami d'industria, a causa della grande diffusione del motore elettrico, le differenze sono di molto minor rilievo e spesso non si avvertono nemmeno nelle cifre percentuali o nei vari rapporti o coefficienti.

Si riassumono qui di seguito le differenze riscontrate :

Potenza complessiva (3) (comprese le riserve) (4)	Cifre	
	pubblicate	corrette (4)
a) nel Regno. CV	8.672.069 (5)	4.624.400
b) delle industrie elettriche, ecc. . . . . »	4.020.324 (6)	484.924
c) delle altre classi. . . »	4.651.745	4.139.476

Per i singoli rami d'industria veggasi il prospetto a pagina seguente.

---

segue nota 3.

zioni) che non è compito lieve. Non è quindi escluso che le osservazioni critiche fatte nel presente studio siano state già tenute successivamente nel debito conto da altri Stati o studiosi.

(1) Nel censimento del 1911 si è fatta un'analisi minutissima dei dati relativi alla potenza dei motori primari con dettagli e classificazioni quali non risulta siano stati nè prima nè successivamente compiuti in alcun altro Stato. Epperò la confusione dei concetti inerenti alla valutazione della potenza non consente di fare riferimenti e calcoli precisi. È comunque escluso che vi siano state fatte duplicazioni di potenza. Risulta infatti che la potenza dei motori primari installati (*P*) è di CV 1.620.404 e di questi *CV* 977.906 erano trasformati in energia elettrica (*Pg*) al netto delle perdite di trasformazione. Per cui la potenza dei motori primari azionanti direttamente il macchinario ($Pm = P - Pg$) può considerarsi di CV 642.498 (in realtà sarebbe un pò inferiore se non si tenesse conto delle perdite). Per quanto riguarda i generatori ed i motori elettrici vengono fatte diverse confusioni (cfr. par. 5, pag. 122 del vol. 5, *Relazione Censimento degli opifici e delle imprese industriali al* 10 *giugno* 1911, pubblicato dal MINISTERO DELL'AGRICOLTURA INDUSTRIA E COMMERCIO - DIREZIONE GENERALE DELLA STATISTICA E DEL LAVORO - UFFICIO DEL CENSIMENTO, Roma, 1911) nel senso che non è dato distinguere i generatori dai motori elettrici e, altresì, che non si considerano gli usi diretti. La potenza dei motori elettrici veri e propri azionati da energia prodotta all'interno (*Ei*) sarebbe di CV 198.172, quella dei motori elettrici azionati dall'esterno (*Ee*) di CV 387.989 (cfr. Rel. cit. pag. 124) per cui la potenza complessiva di tutti i motori elettrici (*E*) sarebbe di CV 586.161. Aggiungendo questa cifra a quella dei motori primari azionati direttamente il macchinario (642.498) si avrebbe una potenza globale di CV 1.228.659 per l'azionamento del macchinario. Tale è infatti la potenza che è stata calcolata nella citata relazione (al par. 6 pag. 126), potenza che è stata denominata impropriamente « energia consumata » in opposizione ad una potenza denominata « energia prodotta », corrispondente alla potenza meccanica dei motori primari (*P*) (1.620.404) diminuita della supposta perdita di potenza in seguito alla trasformazione di una parte dell'energia meccanica dei motori primari azionanti generatori elettrici pari a CV 194.344 (corrispondenti a circa il 20 % dei CV 977.906) cioè : CV 1.426.060. Questo dato della supposta produzione non può però correttamente confrontarsi col precedente comprendendo quest'ultimo anche la potenza non destinata ad azionare il macchinario (cfr. par. 14 scopo 4° formula 32) e, altresì, la parte destinata ad altre attività non industriali — escluse dal censimento.

(1) Vol. VIII, *Relazione generale*, parte I : *Industria*, Roma, 1932-X.

(2) Salvo una lodevole eccezione nelle tavole IV e V relative agli « HP dei motori normalmente in funzione » (escluse cioè le riserve) (pag. 138 a 148) nella quale si sommano, più razionalmente, la potenza dei motori elettrici *in funzione* con la sola potenza dei motori primi destinati al funzionamento dei macchinari (escludendo cioè la parte destinata ai generatori di elettricità). Ma tale cifra corretta non viene utilizzata nei prospetti della relazione illustrativa che fanno per contro riferimento alla potenza utilizzabile calcolata con la duplicazione cui si accenna nel testo.

(3) Compresi : i servizi ; *trasporti* e comunicazioni.

(4) Per calcolare correttamente la potenza in riserva dei motori primi, spogliata e pubblicata in una cifra complessiva — relativa cioè sia alla riserva dei motori primi azionati direttamente il macchinario, sia quelli azionanti i generatori elettrici — si è suddivisa la cifra stessa in parti proporzionali alle potenze pubblicate per i motori primari dei motori funzionanti per i due scopi suddetti.

(5) Cfr. Relazione citata pagg. 8, 64, 72 della Relazione illustrativa e tavv. I (pag. 97 e II (pag. 133).

Se si avesse avuto cura di far figurare l'industria elettrica soltanto con la potenza dei motori elettrici installati gli errori sarebbero stati ridotti a proporzioni di scarsa entità per una buona parte dei rami d'industria.

2) *Duplicazioni nella sola totalizzazione.* — Dalla più volte citata pubblicazione «*La statistique des forces motrices en* 1926» — fondamentale in materia, anche per la chiara e sostanziosa illustrazione delle formule da usarsi per il calcolo, *in ciascuna branca d'industria* — togliamo (1) — riassumendo i dati delle varie classi d'industria e mettendo invece in evidenza i trasporti (2) — i seguenti dati:

RAMI DI ATTIVITÀ	POTENZA IN KW			
	Motori primari	Motori elettrici (azionati dall'esterno)	Potenza utilizzabile (a) secondo le cifre	
			pubblicate	corrette (c)
1	2	3	4	5
Pesca, foreste, agricoltura.	146.833	965	147.798	147.798
Industrie estrattive	1.063.228	59.850	1.123.078	1.123.078
Industrie trasformazione (esclusa l'ind. elettrica).	3.852.301	1.514.915	5 367.216	5.367.216
Ferrovie e tramvie	165.687	27.111	192.798	(b) 192.798
Altri rami	153.120	74.942	228.062	228.062
Industria elettrica	3.410.620	40.540	3.451.160	(a) 1.732.837
TOTALE	**9 791 789**	**1 718 323**	**10 510 112**	**8 791 789**

(a) Supponendo si tratti dello scopo quarto e, altresì, che soltanto l'industria elettrica venda energia a terzi — il che non è — una parte della differenza tra la potenza dei motori primari (3.410.620) e la cifra corretta (1.732.837) e cioè kW 1.718.323 dovrebbe essere attribuita agli altri rami di attività acquirenti di energia appunto per kW 1.718.323. D'altra parte risulta che le industrie minerarie vendono energia a terzi (cfr. nota (3) alla colonna seguente).

(b) S'intendono compresi i trasporti a trazione elettrica. Volendo escludere i trasporti, in conformità alle proposte dell'Ist. Int. di Statistica si dovrebbe anche escludere quella parte di questa potenza destinata alla trazione elettrica, compresa in questa cifra e nella cifra dell'industria elettrica.

(c) *senza tenere conto della correzione che si dovrebbe apportare per dedurre la potenza corrispondente all'energia venduta (V) (cfr. avanti pag. 45*).*

(1) Pag. 19 della citata «Statistique des forces motrices».

(2) Da pagg. 42 e 43 della «Statistique des forces motrices».

Con l'inclusione di tutti i motori primari dell'industria elettrica questa figura, anzichè con 40.540 kW soltanto, secondo le nostre conclusioni (escludendo che vi sia installato del macchinario vero e proprio mosso direttamente da motori primari) con una potenza di 3.451.160.

Si commettono così errori (duplicazioni) di maggiore o minore entità a seconda del significato che si vuole attribuire al calcolo (cioè a seconda degli scopi di questo).

Se si volesse attribuire al totale di 10.510.122 kw il significato di potenza utilizzabile complessivamente in Francia soltanto per azionare il macchinario (scopo 1°) si avrebbe:

a) una duplicazione per l'energia venduta sia da industrie elettriche, sia da altre industrie che producono energia per azionare il macchinario (cioè per alimentare motori elettrici *Ee*). A questa potenza venduta corrisponderebbe, in parte, la potenza dei motori elettrici azionati dall'esterno (energia acquistata) e cioè 1.718.323 kW (*Ee*) conteggiati alla colonna 3.

b) un eccesso di valutazione per l'energia venduta per usi diretti (illuminazione, ecc.) e per la trazione elettrica (essendo i trasporti esclusi dal calcolo) ($Ue + Re = Vu + Vr$).

Supponendo che soltanto l'industria elettrica vendesse energia a terzi (3) (per qualsiasi uso, compresa

(3) Sembra che la vendita di energia sia effettuata in misura non trascurabile anche da altre industrie dove sono installati generatori elettrici di potenza considerevole e, cioè, in particolare, nelle industrie minerarie e nelle industrie metallurgiche. Pel 1926 non si hanno dati al riguardo, ma dalle statistiche più estese del censimento delle forze motrici del 1931 risultano installati nelle miniere e nelle industrie metallurgiche generatori elettrici

la trazione elettrica) la vendita complessiva in Francia corrisponderebbe all'intera potenza *primaria* dell'industria elettrica cioè 3.410.620 kW.

Poichè la parte di questa potenza destinata ad azionare il macchinario di altre attività (Vm) è di 1.718.323, la residua parte (3.410.620 — 1.718.323 = 1.692.297 kW) costituirebbe la potenza che le altre branche di attività destinano (acquistano) ad usi *diretti* (riscaldamento, applicazioni elettrotermiche, elettrochimiche) e alla trazione elettrica : $Ue + Re = Vu + V_r$. Questa potenza dovrebbe essere quindi dedotta quando si volesse considerare soltanto la potenza destinata ad azionare il macchinario. Quindi la detrazione da operarsi sarebbe, per le ragioni indicate ai punti *a*) e *b*), di 3.410.620 (1.718.323 + 1.692.297).

c) un altro eccesso di valutazione per l'energia prodotta all'interno degli stabilimenti e da questi destinata ad usi *diretti* interni (illuminazione interna, trazione elettrica interna) di difficile valutazione (1).

Se invece si attribuisce al totale di 10.510.112 kW il significato di potenza utilizzabile nell'intera Francia per qualsiasi uso, compresi gli usi diretti e la trazione elettrica (2) (ma esclusi i trasporti non elettrici) (scopo quarto) — come si è supposto nell'indicare le cifre corrette della col. 5 — si avrebbe una duplicazione per le ragioni indicate al punto *a*) precedente, cioè di 1.718.323 kW. La potenza utilizzabile infatti deve in questo caso corrispondere — per il totale dell'intero Paese — alla potenza di tutti i motori primari installati di 8.791.789 e a non più di tanto.

Attribuendo quindi al calcolo quest'ultimo scopo le cifre *complessive* della *statistica francese delle forze motrici del* 1926 *conterrebbero un errore di duplicazione* (3) di 1.718.323 kW (10.510.112 — 8.791.789) pari al 17% della potenza installata.

Alle industrie di trasformazione che nelle cifre originali della pubblicazione francese verrebbe attribuito il 51,1% della potenza totale, spetta in realtà il 61,0%. Anche i coefficienti della potenza installata per stabilimento con forza motrice, e i CV per 100 salariati restano alterati per le industrie elettriche e per il totale.

OGGETTO	POTENZA IN CHILOWATT			
	per stabilimento con f. m.		per 100 salariati negli stabilimenti con f. m.	
	cifre pubblicate	cifre corrette	cifre pubblicate	cifre corrette
Industria elettrica	3.152	1.582	13.444	6.750
Totale della Francia . . .	84	70	269	225

Dell'errore di totalizzazione commesso nella statistica del 1926, sembra si sia avveduto l'Ufficio compilatore che, infatti, nel successivo censimento del 1931 (*Statistiques des forces motrices en* 1931, Paris 1936) avverte che occorre escludere dal calcolo della potenza installata per l'insieme della Francia le centrali di distribuzione di elettricità. « *La potenza di queste farebbe, in effetti, doppio impiego con la maggior parte dei motori elettrici alimentati con energia acquistata all'esterno* » (p. 23).

I risultati presentati pel 1931 si riassumono nella tabella seguente tratta da quella più dettagliata del volume francese (pag. 28) :

RAMI DI ATTIVITÀ	POTENZA IN MIGLIAIA DI KW			
	Motori primari nel 1931	Motori elettrici (azionati dall'esterno, ecc.)	Potenza installata	
			nel 1931	nel 1926
1	2	3	4	5
Pesca, foreste, agricoltura.	160	2	162	148
Industrie estrattive	1.327	223	1.550	1.123
Industrie trasformazione (esclusa ind. elettr.). . . .	4.543	2.532	7.075	5.367

Altri rami	197	186	383	228
TOTALE . . .	**6.406**	**2.949**	**9.355**	**7.059**
Industria elettrica.	4.935	2	4.937	3.451

segue nota 3.

(azionati da motori a vapore e idraulici, che costituiscono la maggior parte) complessivamente kW 1.729.000 contro circa 4.836.000 kW delle generatrici delle industrie elettriche (cfr. vol. *Statistique des forces motrices en* 1931, Paris 1936 : Tav. II pag. 48 e seguenti). Nelle industrie minerarie sono kW 917.000 contro una potenza nominale di motori elettrici azionati dall'interno (cioè da dette generatrici) di soli kW 707.813. Nelle industrie metallurgiche la potenza delle generatrici (a vapore e idrauliche) è di 812.000 kW. Ma vi è, per contro, una potenza dei motori elettrici azionati dall'interno di 1.316.389 kW che è molto superiore (anche tenuto conto di una perdita di trasmissione). Ciò potrebbe significare che non esista vendita di energia e che vi siano motori elettrici di riserva (o comunque azionabili alternativamente) per una potenza molto superiore a quella disponibile (cfr. par. 20), oppure che la potenza di riserva dei motori elettrici sia tale da superare anche la potenza corrispondente all'energia venduta.

(1) La potenza destinata ai trasporti elettrici (da escludere dal calcolo quando si voglia conoscere soltanto la potenza per azionare il macchinario) sarebbe compresa in parte fra la potenza corrispondente alla energia venduta per la trazione elettrica ed esclusa dal calcolo ; l'altra parte, pure esclusa, sarebbe costituita dalla potenza corrispondente all'energia di cui al punto *c*).

(2) Che la trazione elettrica sia compresa nel calcolo risulta anche dal testo della Relazione che precede le tavole statistiche nella quale (a pag. 7) è osservato che l'indagine lascia da parte la potenza dei mezzi di locomozione « *salvo quella che corrisponde alle officine centrali di trazione elettrica* ». Anche nel successivo censimento del 1931 si segue lo stesso criterio ; è infatti detto (a pag. 15) che fra i motori primari censiti si comprendono i « motori fissi » delle officine di trazione elettrica, delle stazioni, depositi e laboratori delle compagnie di ferrovie e tramvie ».

(3) Duplicazione evidente, d'altronde, anche a prescindere dai suddetti ragionamenti, in quanto come è affermato nello stesso volume (pag. 230) « per l'insieme delle forze motrici di un Paese. . ., non vi è doppio impiego se si totalizza soltanto la potenza dei motori primari, lasciando fuori i motori elettrici ». Invece il totale della col. 2 (8.791.789 kW) supera (appunto di 1.718.323 kW) la potenza totale della col. 4 (10.510.112 kW).

Pur rettificando l'errore di duplicazione commesso nel 1926, i dati della tabella precedente con l'effettuata separazione dei dati relativi all'industria elettrica (ultima riga) e con la mancanza di una somma totale per l'intera Francia, dànno alle cifre un valore equivoco nei riguardi del loro significato, cioè degli scopi del calcolo (1). Infatti il totale di 9.355.000 kW ($P + Ee$) non sta ad indicare la potenza utilizzabile per azionare il macchinario ($Pm + E$). Detta cifra comprende infatti in più la potenza corrispondente all'energia elettrica venduta nonchè la potenza corrispondente all'energia prodotta all'interno e impiegata all'interno dagli stabilimenti stessi per usi diretti e trazione elettrica. Nè la cifra in questione può essere attribuita ad alcuno dei quattro altri scopi da noi considerati. Peraltro la cifra delle industrie elettriche, indicata a parte (kW 4.937.000) non può sommarsi con la cifra soprastante nella tabellina a pagina precedente (per evitare le duplicazioni già lamentate) e non ha un preciso significato (1).

Il valore $P + Ee$ per l'intero Stato (considerando tutte le categorie di attività economiche), eccede della quantità di Ee la potenza *massima* installata attribuibile ad uno Stato (che non può superare P prescindendo dall'importazione ed esportazione di energia ad altri Stati).

Mentre la mancata deduzione di V dai kW 9.355.000 può essere in pratica di non notevole entità, il valore di V per l'industria elettrica è pari a circa kW 4.916.000 su 4.935.000 (19.000 essendo i kW dei motori elettrici azionati dall'interno: cfr. pag. 53 del volume francese del 1931).

L'equivoco sistema è stato impiegato in diversi Paesi: cfr. STATISTIQUE GÉNÉRALE DE LA FRANCE. *Statistiques des forces motrices en* 1926) e dipende dall'applicazione *parziale* della formula di cui al criterio (A), cui si ricorre quando — essendo difficile calcolare per i singoli rami d'industria la potenza corrispondente all'energia da essi venduta — se ne omette la detrazione nell'ipotesi che si tratti di quantità trascurabili. Ciò che può anche essere, salvo, che per la industria elettrica dove invece quasi tutta la potenza installata corrisponde all'energia venduta. Comunque l'errore in eccesso varia da branca a branca d'industria a seconda della maggiore o minore quantità di energia venduta.

3) *Incerto significato dei risultati.* — Esempio di possibile equivoca interpretazione dei risultati sono stati sopra esemplificati ed altri se ne riscontrano ogniqualvolta si pubblica il dato della potenza complessiva dei motori primari « installati » nello Stato (ΣP) relativo alle sole « industrie » vere e proprie, esclusa la branca « trasporti » ma compresa invece la branca « industria elettrica » con l'intenzione (espressa o sottintesa) di fornire, in tal modo, il dato della potenza complessiva « utilizzabile » per le *industrie vere e proprie* (per qualsiasi uso esclusi i trasporti: scopo quarto). In tal modo, invece, si comprendono anche i dati della potenza « utilizzabile » sia per i trasporti elettrici (per lo più azionati con energia delle centrali elettriche censite nella branca « industria elettrica ») sia, altresì, ad altre branche di attività economica non industriale (per la parte di potenza corrispondente all'energia elettrica acquistata, per lo più dalle « industrie elettriche », la cui potenza primaria è compresa nel calcolo) che si intendeva invece escludere dai conteggi. (Cfr. paragr. 16 punto B pag. 39*).

Il dato ΣP ha un significato preciso di potenza utilizzabile nello Stato quando si riferisca a *tutte le branche di attività economica*, altrimenti si può fare confusione fra potenza primaria materialmente installata e potenza « utilizzabile » dall'attività trasformatrice propriamente detta delle industrie vere e proprie.

§ 18. - Sulla preferenza da accordarsi ai tre criteri (A) (B) (C). — Teoricamente l'applicazione dell'uno o dell'altro dei tre criteri indicati dovrebbe condurre all'identico risultato se sussistesse la ipotesi, premessa (cfr. paragr. 6), circa l'equivalenza tra la potenza del motore primario e quella del generatore elettrico da essa azionato e, altresì, tra potenza del generatore (o del motore primario) e potenza del motore elettrico da esso alimentato (anche a distanza). Le equivalenze teoriche sono però ben lungi dal corrispondere alla realtà (cfr. paragr. 20) e lo scostamento tra questa e i risultati ottenuti applicando le formule ottenute con i tre criteri può variare a seconda che si impieghi l'uno o l'altro. Ma di queste differenze non è possibile tener conto.

Accolta quindi per vera l'ipotesi dell'equivalenza suddetta occorre esaminare se e per quali ragioni si debba accordare, nell'applicazione pratica, la preferenza all'uno piuttosto che all'altro.

Le preferenze dipendono da tre serie di ragioni.

1) in primo luogo da ragioni inerenti alla pratica rilevazione dei dati e cioè, da un lato, alla maggiore o minore possibilità da parte dei censiti di fornire dati esatti con il minimo disturbo possibile (compatibilmente, s'intende, con i fini della rilevazione stessa) e, dall'altro lato, alla possibilità di formulare i quesiti da introdurre nei questionari di

(1) Peraltro nella stessa pubblicazione (pag. 24) si ripete l'errore di mettere a confronto la potenza « utilizzabile » dall'industria elettrica (senza però indicare lo scopo) con l'analoga potenza degli altri rami d'industria (destinata, invece, al solo scopo di azionare il macchinario).

rilevazione, con la maggiore chiarezza e semplicità e, altresì, di ridurli al minimo.

2) In secondo luogo dalla maggiore o minore semplicità degli spogli necessari per ottenere la potenza indicata dalle formule stesse (si tratta da noi, per i soli censimenti industriali, di spogliare oltre un milione di questionari).

3) In terzo luogo dalla maggiore o minore probabilità di ottenere dati attendibili o scostantisi il meno possibile dalla realtà.

CRITERIO (*A*).

Per ciò che concerne le notizie sui motori primari (*P*) questo criterio ha il vantaggio di non richiedere ai censiti che il numero e la potenza installata senza preoccuparsi di conoscere il numero e la potenza dei motori destinati ad azionare direttamente il macchinario (*Pm*) o generatori elettrici (*Pg*).

Per contro, si presentano tre svantaggi notevoli.

1) Per i motori elettrici occorre, in primo luogo, richiedere separatamente notizie sul numero e potenza dei motori elettrici *a*) azionati dall'interno; *b*) azionati dall'esterno, con energia elettrica di acquisto; *c*) azionati alternativamente nell'uno o nell'altro modo (caso non infrequente). La complicazione aumenta quando, come è norma, si debbono chiedere i motori in riserva (per ciascuna delle tre categorie suddette).

Inoltre si deve ricorrere a calcoli congetturali, per suddividere la potenza della categoria *c*) fra le prime due (1).

2) Obbliga a calcolare la potenza corrispondente all'energia elettrica eventualmente venduta. Questo difetto è assai grave e, come si è detto (cfr. paragr. 4 e paragr. 9), viene a intaccare gli stessi principi posti a base del calcolo. Il passaggio dal consumo (in kWh) alla potenza non può sempre compiersi correttamente e implica comunque la rilevazione di diversi dati (cfr. paragr. 9).

Nel corso del lavoro si è visto che l'adozione del criterio (*A*) richiede sempre particolare attenzione e calcoli più complessi. Si è anche ricordato che la stessa Svizzera che lo usò in passato (ne schizzò l'impiego fin dal 1901) lo abbandonò nel censimento del 1937.

CRITERIO (*B*).

Lo svantaggio di questa formula riguarda soltanto la necessità di dover richiedere al censito la distinzione fra motori primari azionanti direttamente il macchinario e motori azionanti generatori elettrici. Questa distinzione, non richiesta dal criterio (*A*), complica il questionario — specialmente se si debbono richiedere, come di norma, il numero e la potenza dei motori in riserva per ciascuno dei due scopi suddetti — e obbliga, da una parte il censito a compiere calcoli congetturali imprecisi nel caso, non infrequente, di motori primari che servano alternativamente ai due scopi (2), e dall'altra ad inserire nel questionario norme apposite per l'esecuzione di tale calcolo.

L'applicazione del criterio (*B*) non richiede, per contro, nessuna distinzione di categoria di motori elettrici, nè notizie sull'energia venduta come nel caso della formula (*A*). Come risulta dalla parte inferiore del prosp. 3 il criterio (*B*) costituisce il sistema più spontaneo ed aderente alla realtà per determinare la potenza utilizzabile.

CRITERIO (*C*).

Non presenta nessuno degli inconvenienti indicati per i criteri (*A*) e (*B*); richiede però di aggiungere nel questionario un quesito apposito sui generatori installati. Ma tale richiesta è importante, per tutti gli studi sulle macchine produttrici di energia in genere, ed ormai viene rilevato nella maggior parte dei Paesi.

Naturalmente se sul questionario di censimento si chiedono notizie separate per i generatori, basta togliere la loro potenza da quella di tutti i motori primari censiti per ottenere il valore di P_m (vedi criterio C).

---

(1) L'Istituto Internazionale di Statistica (cfr. *Bulletin*, ecc. citato, Tome XXIX, deuxième livraison, Atene, 1936, pag. 220) consiglia di suddividere la potenza della categoria *c*) in parti proporzionali al *consumo* di energia prodotta all'interno e acquistata. Occorrerebbe quindi richiedere tali dati al censito che non è sempre in grado di fornirli, specialmente quello dei kWh consumati con energia prodotta all'interno. A prescindere dalla maggiore complicazione del questionario, i dati di consumo suddetti possono portare a risultati imprecisi, anche perchè il consumo (e la durata di utilizzazione) possono non essere in rapporto alla potenza. Più semplice e meno scorretto il sistema di dividere la potenza della categoria *c*) in parti proporzionali alla potenza dei motori delle due categorie *a*) e *b*). Nè, d'altronde, si tratta di potenze sempre trascurabili. In alcune sottoclassi dell'industria chimica, ad es., si è rilevato in occasione del censimento 1938 una percentuale di motori azionati promiscuamente del 50,9% nelle chimico-estrattive; del 35,6 % nell'industria dell'alcool etilico; del 25,7% nell'industria della distillazione del carbon fossile, ecc. In media, per l'intera classe, la percentuale è del 14,5%.

(2) Si dovrebbe (cfr. il voto dell'Istituto Internazionale di Statistica del 1936, Bulletin citato, Tome XXIX, 3e livraison, Atene) dividere la potenza secondo la *durata media di utilizzazione* per uno scopo e per l'altro. Tale durata media molto spesso non è nota al censito se non in modo approssimativo e sarebbe per di più opportuno richiederla motore per motore. (La divisione fra le due categorie è possibile per la potenza, ma non per il numero). Naturalmente se nel questionario di censimento si chiedono notizie separate per i generatori, basta togliere la loro potenza da quella di tutti i motori primari censiti, per ottenere il valore di Pm (vedi criterio (*c*)).

* * *

Le preferenze sarebbero quindi a favore del criterio (*C*): per le minori complicazioni che richiede al questionario; per la maggiore semplicità delle domande; per la maggiore facilità e precisione con cui il censito può rispondere alle domande (e quindi per la maggiore esattezza dei dati denunciati); per la maggiore facilità degli spogli.

Esso dà gli stessi risultati del criterio (*B*) (essendo $Pm = P - G$) senza presentarne gli svantaggi. Vi è per contro lo svantaggio di operare per differenza (2) (cfr. paragr. 21).

Nei vari Stati il criterio corretto più usato è il (*B*), di cui il (*C*) non è che una derivazione.

È quindi pienamente giustificata la proposta fatta all'Istituto Internazionale di Statistica da RIEMER di raccomandare ai diversi Paesi l'adozione di un'*unica* formula, la più corretta e la più semplice, che corrisponde (RIEMER, Bulletin citato, pag. 102) al criterio (*B*) o al suo equivalente (*C*).

In pratica è però consigliabile, se possibile, di richiedere sempre — anche usando il criterio (*C*) — notizie sui motori elettrici azionati dall'esterno e — anche usando il criterio (*A*) o (*B*) — notizie sui generatori elettrici. Non solo per ragioni di reciproco controllo dei dati che — come si è detto e come si dirà al paragrafo 20 — sono sempre largamente approssimativi, ma anche per i diversi calcoli che si rendono utili nello studio della questione e, altresì, *per compiere confronti internazionali* ai quali fini è opportuno usare lo stesso criterio impiegato dallo Stato estero posto a confronto.

§ 19. - Critiche alle raccomandazioni dell'Istituto Internazionale di Statistica. — L'Istituto Internazionale di Statistica nella sua sessione di Atene del 1936, più volte citata, ha raccomandato, per il calcolo della « *potenza totale dei motori a disposizione di ogni branca d'industria* » di usare uno dei due valori seguenti:

« *a.* potenza totale dei motori primari che non servono alla produzione di elettricità, più potenza totale di tutti i motori elettrici. *Tuttavia, per le centrali elettriche, si prenderà la potenza totale dei motori primari* ».

« *b.* potenza totale di tutti i motori primari, più potenza dei motori elettrici alimentati con corrente acquistata dall'esterno, meno potenza totale corrispondente all'energia elettrica venduta ».

Si tratta, insomma, rispettivamente, dell'uso di quelli che nei precedenti paragrafi abbiamo chiamati criterio (*B*) e criterio (*A*).

Nel testo della deliberazione si parla di « forze » motrici, come uno degli elementi essenziali della produzione e del calcolo della potenza (meccanica o motrice) « a disposizione » di ciascun ramo di industria. Si può così ritenere che lo scopo del calcolo sia limitato allo scopo primo, cioè alla determinazione della potenza meccanica o « motrice » destinata ad azionare il macchinario. Tale scopo si desume sia dal testo del « progetto di raccomandazione » (3) che precede la raccomandazione votata e dalla discussione fatta (4) come pure dalla relazione che accompagna il progetto di raccomandazione (5).

Dato ciò, si nota una prima grave contraddizione fra la prima formula *a* — che, come sappiamo, calcola esclusivamente la potenza destinata ad azionare il macchinario, direttamente o a mezzo di motori elettrici, esclusi i trasporti, interni od esterni (6) —

(1) In base alle equivalenze indicate nelle premesse al prospetto 2, si possono, teoricamente almeno, ricavare molte altre formule e dati interessanti, i quali però avrebbero praticamente maggiori svantaggi di quelli sopra indicati per tre formule di uso corrente (cfr. § 21).

(2) In realtà (*P-G*) può differire da *Pm*. Quando tutta la potenza dei motori primari fosse destinata ai generatori la potenza (*P-G*) dovrebbe essere uguale a zero, mentre, *in teoria G* per essere uguale a *P* deve essere aumentato di almeno 5% circa a causa delle perdite di trasformazione. Nel Regno Unito, dove si è usata questa formula, prima di effettuare la sottrazione indicata, si aumenta del 10% il valore di *G* (cfr. HUBER, lavoro cit., pag. 216 e nota 3 a pag. 20), salvo il caso di generatrici mosse da turbine a vapore (cfr. nota (2) a pag. 19 par. 4). Ma le perdite di energia pel trasporto a distanza implicano differenze ben maggiori di queste indicate: si tratta di un'altra questione che tratteremo al paragrafo seguente.

Nel caso di motori primari accoppiati a generatori, abbiamo anche visto (cfr. par. 3) come si preferisca in pratica chiedere la potenza dei soli generatori, quasi sempre muniti di targa (mentre spesso ciò non si verifica per i motori primari), e considerare questa eguale a quella dei motori primari. Quando esistono due targhe (una del motore primario ed una del generatore accoppiato) è frequente l'indicazione di potenza identica se si tratta di generatori a corrente continua. Per i generatori a corrente alternata interviene sempre il dato approssimativo del fattore di potenza ($\cos \varphi$) come si è detto al par. 3, pag. 10*, seguito nota (4), e pag. 12*, nota (1).

Inoltre P può essere inferiore a G nel caso in cui, ad es., lo stesso motore primario azioni alternativamente due generatori ciascuno di potenza uguale al motore primario (cfr. pag. 51*).

(3) Pag. 219 del XXIX volume, 3e livr. del Bulletin, cit.

(4) Pag. 100-103 del XXIX volume, 1e livraison, cit.

(5) Pag. 212-219 del XXIX volume, 3e livraison, cit.

(6) Secondo le decisioni approvate dalla seduta plenaria dell'Istituto Internazionale di Statistica, il dato relativo alla potenza *dei trasporti* deve essere calcolato separatamente da quello delle forze motrici ma dovrebbe escludere i trasporti che servono all'interno dello stabilimento (punto 1° della deliberazione della Sessione di Atene).

Da ciò si dovrebbe quindi arguire che i trasporti allo *interno* degli stabilimenti (siano essi *elettrici* o non elettrici) debbano essere compresi nelle formule *a* e *b*, mentre dalla *a* sono esclusi. Vi è quindi una confusione fra gli scopi della formula di cui al punto *b* — potenza utilizzabile per tutti gli usi, *compresi i trasporti elettrici interni* (scopo quarto del nostro studio) — e lo scopo della formula di cui al punto *a*, potenza utilizzabile per azionare soltanto il macchinario (primo scopo del nostro studio) esclusi i trasporti elettrici interni. Per le critiche relative a queste decisioni vedasi § 24, nota (1) pag. 58*.

e la seconda formula *b* nella quale è invece compresa anche la potenza dei motori primari che producono energia destinata all'*interno* dello stabilimento stesso, per illuminazione, usi termici, usi elettrochimici e anche per trazione elettrica ($Ui + Ri$).

Ciò a prescindere dal concetto stesso su cui la formula *b* si basa e che abbiamo già criticata al paragr. 3 : l'unico Stato che l'aveva adottata in passato (per oltre 30 anni) la Svizzera, ne abbandonò l'impiego col 1937.

Inoltre la parte della deliberazione relativa al punto *a* : « *tuttavia per le centrali elettriche si prenderà la potenza totale dei motori primari* » può produrre gravi errori di calcolo o quanto meno di interpretazione.

Il fatto di aver voluto deliberatamente inserire questa precisazione sulle « centrali elettriche » soltanto nel punto *a* e di non aver fatto di queste alcun cenno nel punto *b* dovrebbe logicamente interpretarsi nel senso che l'applicazione di quest'ultima formula dovrebbe compiersi senza alcuna particolare riserva o variante per la potenza delle centrali elettriche. Ora, applicando la formula di cui al punto *b* le imprese elettriche figurerebbero con una potenza minima o addirittura nulla, poichè esse destinano tutta o quasi l' energia prodotta alla vendita. L' aggiunta per le « centrali elettriche » fatta per una sola formula è errata, non essendovi nessuna ragione perchè due formule, da usarsi indifferentemente, portino, applicate alle centrali elettriche, a differenze così rilevanti.

Come è noto la potenza primaria delle centrali elettriche rappresenta in molti Paesi come l'Italia, una potenza superiore a quella destinata nell'intero Stato ad azionare il macchinario di tutte le industrie. (In Italia nel 1938-40 : 7,4 milioni di CV di potenza primaria delle industrie elettriche e 1,7 negli altri rami d'industria). Inoltre, per la formula di cui al punto *a* vi è una evidente contraddizione in termini : le centrali elettriche figurerebbero infatti con tutta la potenza dei motori primari accoppiati ai generatori per produrre elettricità mentre gli stabilimenti industriali che producono energia elettrica all'interno dello stabilimento, per venderne soltanto una parte, non si vedrebbero assegnata alcuna potenza relativa ai motori primari.

Nè dai documenti consultati si può pensare ad una difettosa redazione tipografica del testo nel senso che la citata aggiunta per le centrali elettriche, ecc. dovesse riferirsi ad entrambi le formule raccomandate.

* * *

L'aggiunta fatta alla raccomandazione *a* per le industrie elettriche sta comunque a significare che le centrali elettriche si sono considerate come appartenenti all'« industria ».

Ciò può essere fonte di due altri gravi equivoci. In primo luogo se la raccomandazione dell'Istituto Internazionale di Statistica è limitata, come risulterebbe dal testo letterale della raccomandazione, alla potenza disponibile in *ciascun* ramo di « industria » l'inclusione di tutti i motori primari dell'industria elettrica sarebbe in contrasto con la limitazione suddetta in quanto i motori primari delle centrali elettriche forniscono energia a rami di attività che possono non essere compresi fra le « industrie ». La potenza primaria delle centrali elettriche è destinata ai trasporti elettrici e persino alle aziende domestiche. Si tratterebbe bensì di potenza « installata » nelle industrie elettriche, ma non di potenza « utilizzabile » dalle medesime (cfr. paragr. 4).

Sorge inoltre la questione alla quale, ripetutamente, abbiamo accennato nei paragrafi precedenti, circa la totalizzazione delle potenze calcolate in ciascun ramo d'industria per ottenere la potenza globale da attribuire nello Stato all'intera « industria » (o ad aggruppamenti particolari di alcuni rami). A questo riguardo si osserva che tanto nel testo della deliberazione quanto in quello della relazione che l'accompagna, si parla esclusivamente di « singoli rami d'industria » (*chaque branche d'industrie*) e non si accenna mai alla totalizzazione suddetta. Ciò può interpretarsi in due modi opposti : e cioè, da una parte, che non se ne sia accennato ritenendo tale totalizzazione come implicita ed ovvia ; dall'altra, invece che, si sia voluto esplicitamente escludere tale totalizzazione per attribuire al calcolo in questione lo scopo di compiere soltanto separati confronti fra un ramo e l'altro delle industrie senza preoccuparsi di sommare i dati relativi.

Se quest'ultima fosse l'interpretazione da attribuirsi agli scopi del calcolo — a parte la contraddizione per il calcolo della potenza per l'industria elettrica in base al criterio di cui al punto *a* e al punto *b* — si dovrebbe far carico all'Istituto Internazionale di Statistica di non avere esplicitamente e ben chiaramente avvertito il suddetto limitato scopo delle raccomandazioni votate e di non avere altresì messo in guardia lo statistico di non procedere a tali totalizzazioni o di procedervi con particolare cautela e in particolare di attribuire, in caso di somma, alle « centrali elettriche » una potenza minima (corrispondente alla potenza dei soli motori elettrici azionati dall'interno e dall'esterno).

Lo statistico che, dopo aver calcolato il valore della potenza installata, branca per branca, in conformità alle deliberazioni dell'Istituto Internazionale di Statistica, ne sommasse i risultati, commetterebbe un grave errore di duplicazione usando la formula *a*, in quanto alle industrie elettriche dovrebbe essere attribuita — anzichè la potenza dei motori primari installati — una potenza minima o addirittura nulla. Si verificherebbero proprio quei «*doppi impieghi*» che l'Istituto Internazionale di Statistica si proponeva invece, come scopo essenziale delle raccomandazioni, di eliminare.

Va ancora osservato che se al calcolo della potenza installata in un Paese nel suo complesso, non si fa cenno nelle raccomandazioni votate, se ne fa riferimento nella relazione che precede le raccomandazioni stesse. È detto in particolare che «affinchè nel calcolo della potenza totale dei motori in un intero Paese non vi sia doppio impiego, è sufficiente contare separatamente la potenza dei motori primari e quella dei motori elettrici» (1).

Nel citato volume sulla statistica delle forze motrici in Francia nel 1926 era detto in modo più preciso che «per l'insieme delle forze motrici in un Paese non vi è doppio impiego se si *totalizza* solamente la potenza dei motori primari». Ora si è già fatto più volte osservare che sommando la potenza dei motori primari di un Paese (scopo quarto) si elimina, è vero, ogni doppio impiego, ma non ottiene la potenza disponibile per azionare il macchinario o potenza «motrice», ma bensì la potenza corrispondente a tre destinazioni diverse: per azionare il macchinario; per usi diretti; per trasporti elettrici.

Gli scopi sarebbero quindi diversi da quelli che si sono voluti invece precisare per il calcolo della potenza in ciascun ramo d'industria (per il solo azionamento del macchinario) e, per di più, si includerebbe anche una parte della potenza destinata ai trasporti (elettrici) che nelle raccomandazioni votate si sono esclusi dal calcolo.

Queste considerazioni dànno rilievo alle osservazioni fatte all'inizio (cfr. paragr. 4 punto B e pag. 19*), sull'opportunità di precisare sempre gli scopi del calcolo e di far sì che — qualunque sia il sistema adottato — si seguano criteri univoci, in modo che i risultati abbiano l'identico significato tanto se riguardino il singolo stabilimento o sottoclassi o classi d'industria o l'industria nel suo complesso o diversi rami di attività economica o l'intero Paese.

(1) Nella relazione precedente della Sessione di Messico del 1933, era detto: «Per un Paese nel suo insieme, non esiste doppio impiego se si conta soltanto la potenza dei motori primari» (cfr. vol. citato, pag. 520).

§ 20. - I risultati ricavati dalle formule e la realtà - Potenza per la «produzione» e potenza per il «consumo». — Per il calcolo della potenza «utilizzabile» si è partiti da una supposta equivalenza tra la potenza di un motore primario e quella del generatore elettrico da esso azionato e fra questa e la potenza dei motori elettrici alimentati da generatori. Si è inoltre supposto che la potenza utilizzabile per azionare il macchinario sia la stessa tanto se il macchinario venga azionato direttamente, meccanicamente (con cinghie, ad es.) da un motore primario, quanto se il macchinario venga azionato da motori elettrici (alimentati da un generatore azionato da un motore primario della stessa potenza).

Queste ipotesi non rispondono alla realtà, perchè non tengono conto delle perdite di trasformazione di energia, da meccanica ad elettrica o viceversa, nè delle perdite di trasformazione e di trasporto a distanza dell'energia elettrica. Partendo da un motore primario di 100 kW si arriva al motore elettrico con una potenza di circa 70 kW — se i motori sono installati a distanza — o di circa 85 kW se i motori elettrici sono installati nello stesso stabilimento produttore di energia (2). Quindi, in realtà, passando dal motore primario al motore elettrico si ha una perdita, cioè una diminuzione di potenza, variabile dal 15 al 30% (3).

Si deve poi calcolare che il macchinario sia in grado di *assorbire* in media circa il 90% (4) della potenza

(2) Queste cifre hanno, s'intende, soltanto un valore orientativo. Si riferiscono a installazioni di una certa importanza (con potenza superiore ai 1.000 kW ad es.) e si basano su rendimenti medi approssimativi (che in realtà variano anch'essi in funzione della perfezione costruttiva dei motori e generatori, della loro anzianità, del tipo dei motori primari, lunghezza delle linee, ecc.). Si è supposto (cfr. FILIPPO TAJANI, *Il libro dell'energia*, pag. 307 e 308, Società Editrice Intern. Torino, 1942) che con un motore primario di 1.000 kW la potenza dell'alternatore si riduca a 940 (con un rendimento dal 0,93 al 0,95) — il rendimento sarebbe inferiore se si trattasse, anzichè di un alternatore di 1000 kW, di piccole potenze; dopo il trasformatore elevatore si ridurrebbe a 916,50 (rendimento da 0,97 a 0,98, media 0.975); per le perdite di linea si ridurrebbe a circa 797,36 (rendimento da 0,84 a 0,90, media 0,87); dopo il trasformatore riduttore si porterebbe a circa 777,42 (perdita da 0,97 a 0,98 media 0,975), e, infine, con le perdite della rete secondaria e di distribuzione (0,91) a 707,45. Nel caso di una installazione nello stesso stabilimento — senza cioè il trasporto a distanza — si avrebbe solo la perdita del generatore (0,94) e della distribuzione interna (0,91).

(3) Ciò significa, fra l'altro, che il passaggio dai kWh (consumati) alla potenza primaria corrispondente non possa compiersi se non dopo avere aumentati prima i kWh del 15% (se consumo interno) o del 30% (consumo esterno) corrispondenti rispettivamente alle perdite di trasformazione e a queste più le perdite di trasporto.

(4) Si può in pratica arrivare a perdite nulle o quasi (2%) per macchine accoppiate direttamente; a perdite del 5-10% per macchine comandate a mezzo di cinghie o cingoli e a 20-50% per macchine accoppiate a motoriduttori (montacarichi, ascensori, ecc.).

trasmessagli (dal motore elettrico con cui è accoppiato o dal motore primario che lo aziona direttamente). Un motore primario di potenza 100 metterebbe quindi a disposizione del *macchinario* una potenza effettiva variabile da 63 — nel caso di motore elettrico azionato a distanza — a 76,5 — per un motore elettrico azionato all'interno dello stabilimento — a 90 kW, per un motore primario azionante direttamente il macchinario. A pari potenza del motore primario, il macchinario assorbe energia meccanica variabile dal 63 al 90% (42,8% in più).

(Tutto ciò a prescindere dalle perdite che si hanno passando dall'energia *potenziale* dell'acqua, del combustibile, ecc. all'energia meccanica prodotta dal motore primario (1): perdite che precedendo la produzione di energia non vengono prese in considerazione per i fini del nostro studio).

Dalle considerazioni fatte si possono trarre le seguenti conseguenze:

a) poichè l'*energia prodotta* — e quindi la potenza corrispondente — è sempre superiore all'*energia consumata* o consumabile — e quindi alla potenza corrispondente (2) — la potenza primaria o *di produzione* P (Pm; Pg) sarà in realtà sempre superiore alla corrispondente potenza secondaria o di *consumo* (G; Ei; Ui; Ri; Ee; Ue; Re). Rispetto allo stesso luogo di produzione avremo: $Pg > G$; $G > Ei + Ui + Ri + V$. Rispetto ad un luogo di produzione diverso dal luogo di consumo, la potenza secondaria corrispondente all'energia *prodotta e consumata sul luogo di produzione* (Ei, Ui, Ri) sarà superiore alla potenza secondaria corrispondente all'*energia consumata a distanza*, cioè fuori del luogo di produzione (Ee, Ue, Re). Quindi le potenze secondarie corrispondenti all'energia primaria prodotta all'*interno* avranno sempre — *a parità di potenza dei motori primari da cui derivano* — valori superiori a quelli delle corrispondenti potenze secondarie della energia di acquisto, prodotta cioè *all'esterno* (a distanza). Sarà cioè $Ei > Ee$; $Ui > Ue$; $Ri > Re$ e quindi anche $Ei + Ui + Ri > Ee + Ue + Re$. Perciò anche V — potenza corrispondente all'energia venduta calcolata sul luogo di produzione — sarà superiore alla potenza dei motori elettrici (Ee) e delle altre installazioni elettriche (Ue, Re) consumatrici alimentate dall'esterno, cioè $V > Ee + Ue + Re$, come sarà $Vm > Ee$; $Vu > Ue$; $Vr > Re$.

b) Le formule determinate per i cinque scopi contengono dati di potenze corrispondenti in parte ad energia prodotta e consumata sul posto (Pm, Ei Ui, Ri) — o prodotta sul posto e venduta (V) — ed in parte potenze corrispondenti a energia di acquisto (Ee, Ue, Re) prodotta cioè fuori dal luogo di consumo. Esse contengono quindi elementi *misti* di valori di produzione e di valori di consumo, di potenza primaria e di potenza secondaria, di potenza prodotta sul posto e di potenza consumata *a distanza*.

c) Ne consegue che un razionale *confronto* fra « *produzione* » e « *consumo teorico* », cioè fra potenza primaria o « di produzione » e potenza « *disponibile per il consumo* » non si può fare che considerando da una parte il dato complessivo dello Stato (supposto nullo il commercio estero) e di *qualsiasi attività economica* (comprese le aziende domestiche) dei motori primari installati (ΣP) (potenza di produzione) e dall'altra il valore di F (consumo) calcolato con le formule 29, 30, 31 riferite all'intero Stato. Se *si escludesse anche un solo ramo di attività economica nel calcolo di* ΣP o nel *calcolo di* F o in entrambi, il confronto sarebbe erroneo perchè mancherebbero nel dato di produzione, o nel dato di consumo, i possibili corrispondenti controvalori. (Cfr. § 16, punto B).

Anzichè $F = \Sigma P$ sarà dunque $F < \Sigma P$.

d) In conseguenza di quanto detto ai punti precedenti accadrà che quanto maggior peso avranno nelle formule proposte i valori esprimenti i dati riferiti al *luogo stesso di consumo* (Pm, Ei, Ui, Ri — luogo di produzione e di consumo — Ee, luogo di consumo) tanto più il risultato si dovrebbe avvicinare alla reale potenza utilizzabile. Per contro quanto più avranno peso i dati espressi in *termini di potenza primaria*, relativi al *luogo di produzione* (P e V) tanto più il risultato peccherebbe per eccesso. Ciò costituirebbe un motivo di più per dare la preferenza al criterio (B) (o all'equivalente criterio C) in confronto alla formula (A) che contiene i valori P e V.

Senonchè, in pratica, intervengono altre circostanze che possono capovolgere queste considerazioni. Sono le modalità pratiche di utilizzazione effettiva dei motori nel corso del giorno, del mese, degli anni — che si erano volute escludere dal calcolo della potenza utilizzabile — che vengono a sconvolgere le conclusioni teoriche (3).

---

(1) Così, ad es., la potenza *nominale* di un *salto* d'acqua si riduce del 50% usando le antiche ruote idrauliche, e dal 30 al 10% usando turbine idrauliche dalle meno perfette fino alle più moderne. Per l'energia termica (per centrali termoelettriche) l'energia potenziale del carbone si riduce di circa il 40% trasformandosi in vapore. Tanto più moderni e tecnicamente ed economicamente migliori sono gli impianti, tanto più basso è il rapporto fra potenza nominale e potenza media teoricamente utilizzabile.

(2) Pertanto ad es., in uno stabilimento che azioni il macchinario soltanto con energia elettrica prodotta all'interno dello stabilimento (Ei) si dovrà preferire per il calcolo della potenza « utilizzabile » sul luogo di consumo il dato Ei in confronto a P (o a G).

(3) Le modalità dell'effettiva utilizzazione dell'energia da parte dei consumatori condizionano, infatti, le po-

Abbiamo già detto (cfr. paragr. 4, punto *C*) pag. 17)* come i motori elettrici installati in uno stabilimento possono avere una potenza molto superiore (2, 3, 4 volte superiore: cfr., ad es., per la trazione elettrica quanto osservato a pag. 60* nota 1) a quella del motore primario che li alimenta, in ragione non della riserva eventuale, ma della diversa utilizzazione che i motori elettrici possono fare nel corso dell'anno (o del giorno) dell'energia prodotta. Con un motore primario a vapore di 50 kW si possono tenere installati motori elettrici di 200 kW se essi non vengono azionati, *contemporaneamente*, per più di ¼ della loro potenza. Teoricamente si potrebbero considerare i 150 kW installati in più come una riserva (« tecnica », cfr. paragr. 23) e proporre di escluderli dal calcolo. Ma in pratica non è possibile, specialmente in un censimento di massa, pretendere ciò dal censito. Se questi normalmente fa lavorare, ad es., 100 motori elettrici da 2 CV accoppiati a 100 macchine operatrici che lavorano ogni giorno alternativamente in quattro turni, indicherà una potenza di 200 e non di 50 kW. Istruzioni speciali per evitare tali indicazioni sarebbero molto complesse e richiederebbero la disponibilità da parte del censito di dati dettagliati di cui normalmente non dispone.

Si verrebbe in ogni modo a passare dal concetto di potenza utilizzabile a quello di potenza utilizzata (cfr. paragr. 4).

La crescente diffusione dei motori elettrici per azionare macchine, apparecchi, attrezzi ed utensili meccanici, non usati in continuazione — variabile sensibilmente fra Stato e Stato — e la comodità del loro impiego, tende a far sì che in pratica la potenza dei motori elettrici installati superi di molto quella dei motori primari che li azionano (1).

Se riprendiamo l'eguaglianza $F = \Sigma P$, dello scopo quarto, relativa all'intero Stato, possiamo dire che in pratica esistono cause che tendono, a ottenere invece F molto maggiore di ΣP (cfr. § 25).

Ciò va tenuto particolarmente presente nei confronti fra Stato e Stato. Ma molteplici altri elementi di fatto possono agire nello stesso senso o in senso opposto. Fra questi ultimi, ad. es. ricordiamo, come si è già detto:

a) che, la somma delle potenze di targa dei motori primari (P) (potenza prodotta) sia superiore a quella realmente utilizzabile (F) per il consumo (a causa delle perdite di trasformazione e trasporto di energia; azionamento del macchinario a mezzo di motori elettrici, anzichè con azionamento diretto con motore primario ecc.) (2).

b) che talvolta lo stesso motore primario aziona, *alternativamente*, due generatori aventi complessivamente una potenza superiore (doppia, ad es.). È quanto è stato rilevato in un impianto idroelettrico italiano di Predace, dove ad una turbina di 22.000 kW fa riscontro una potenza di due generatori da esso azionati, aventi complessivamente una potenza di 42.000 kW (cfr. Mortara. *Sulle statistiche degli impianti elettrici* in *Revue de l'Institut International de Statistique*: 2 année, livraison 4, janvier 1935, pag. 382).

Può cioè essere: $F \gtreqless P$. L'ideale sarebbe che le differenze in meno e in più si compensassero, ridando così all'eguaglianza teorica suddetta, e a tutte le altre, un maggior grado di approssimazione alla realtà. Ma la varietà degli elementi che possono contribuire ad accrescere o a ridurre lo scostamento tra i due termini delle eguaglianze non consente di precisare l'entità dello scostamento stesso. Le eguaglianze delle formule hanno un carattere di astrazione. Esse possono corrispondere ad *una* delle tante ipotesi che si possono verificare in realtà, ma non si conosce a priori quali possibilità abbiano le ipotesi formulate di rispondere alla realtà, quale si è venuta formando nel tempo in un Paese. Le eguaglianze suddette possono essere considerate come un ideale teorico aritmetico che giova ad impostare correttamente i calcoli e ad interpretare razionalmente i risultati. Con la crescente diffusione dei motori elettrici è però probabile che si tenda ad avere in pratica $F > \Sigma P$, come è il caso per l'Italia (cfr. § 25). Lo scarto tra P ed F diminuirebbe se, anzichè considerare la potenza utilizzabile (F) si considerasse la po-

segue nota 3.

tenze delle installazioni idroelettriche o termoelettriche. Per questo le statistiche sui consumi di energia (kWh) — anzichè della potenza installata (kW) — sarebbero molto più significative e razionali e non darebbero luogo ad equivoci o ad errori di interpretazione. Pertanto esse dovrebbero sempre accompagnare, come è stato proposto (Cfr. LEPRINCE-RINGUET già citato) le statistiche sulla potenza disponibile. Non va peraltro taciuto che si incontrerebbero difficoltà notevoli: per ripartire i consumi per rami d'industria e di attività economica; per calcolare e distinguere i consumi di energia elettrica per azionare motori elettrici (e cioè il macchinario) da quelli per illuminazione, elettrolisi, forni elettrici, riscaldamento; per calcolare i kWh presumibilmente assorbiti dal macchinario azionato direttamente dai motori primari, ecc.

1) Naturalmente le proporzioni fra potenza dei motori primari e corrispondente potenza dei motori elettrici variano anche a seconda dei tipi d'indrustria. Nelle industrie tessili, ad es., che lavorano con maggiore regolarità e continuità, l'eccesso di potenza dei motori elettrici tende ad essere minimo (ad es. 10 %), mentre può essere massimo, ad es., in alcune industrie meccaniche (dal 100% al 300 %).

(2) Agisce in senso opposto il fatto che di solito i costruttori costruiscono motori secondari con una potenza effettiva superiore al 10 % circa a quella di targa (cfr. § 3 pag. 10* seconda colonna) per cui si ha una potenza utilizzabile che viene a compensare in tutto o in parte, le perdite di trasporto a distanza ecc.

tenza « *assorbibile* » dal macchinario e dalle altre installazioni consumatrici di energia, che è inferiore alla potenza « utilizzabile ». Se però si tiene conto anche dei motori *in riserva*, si introduce un nuovo elemento che tenderebbe ad aumentare lo scostamento suddetto, essendo in genere la potenza di riserva dei motori primari —rilevata dai censimenti— proporzionalmente più elevata di quella — pure rilevata dai censimenti — dei motori elettrici. (cfr. paragr. 23).

§ **21 - Calcoli indiretti per differenza.** — Le osservazioni fatte al paragrafo precedente vanno tenute particolarmente presenti quando si intendano ricavare dalle numerose eguaglianze, considerate nei paragrafi precedenti (dalle quali se ne possono derivare molte altre) i valori di dati ignoti operando per differenza. Se le eguaglianze suddette corrispondessero alla realtà esse offrirebbero invero comodi mezzi per dedurne in molti casi i dati di difficile o impossibile rilevazione diretta.

Date invece le sensibili differenze che in pratica possono esistere fra valori che, nelle formule usate, sono considerati equivalenti occorre procedere con molta cautela, accompagnando con le dovute riserve i calcoli stessi.

Finchè si tratta di differenze minime, come sono quelle che intervengono generalmente fra i valori di potenze riferite allo stesso luogo di produzione, esse possono essere trascurate. Così, ad es.: differenza $P - G$ per calcolare la Pm; differenza G ed Ei per calcolare, il valore di $Ui + Ri + V$ (essendo posto $G = Ei + Ui + Ri + V$). Quando non esistesse nello stabilimento nè vendita a terzi, nè trasporti elettrici interni (caso frequente nelle industrie) $G - Ei$ corrisponderebbe al valore della potenza Ui di solito difficilmente determinabile per via diretta. Ma quando le differenze si effettuano fra potenze determinate nel luogo di produzione e corrispondenti potenze sul luogo di consumo, *a distanza*, esse non possono essere trascurate, arrivando come si è visto al paragrafo precedente, al 30% e più.

Teoricamente si potrebbe, in alcuni casi particolari, determinare « per differenza » il valore, da attribuire alla potenza venduta V (di difficile determinazione diretta). Supponiamo di avere determinato il valore di M con il criterio (B) : $M = Pm + E$ per *lo scopo primo*. Sappiamo che è anche

$$M = P + Ee - (V + Ui + Ri) \quad \text{(criterio } A\text{)}.$$

Qualora si conoscessero i valori di P e di Ee e forse nullo il valore di $Ui + Ri$ il valore di V si otterrebbe deducendo da $(P + Ee)$ il valore di M : $(P + Ee) - M = (P + Ee) - (P + Ee - V) = V$.

Senonchè, il valore di Ee può essere minore di circa un 30% alla potenza corrispondente all'energia acquistata, misurata al luogo di vendita (alla centrale elettrica : Vm) e quindi il valore di V misurato al luogo di consumo peccherebbe per difetto rispetto al valore di V misurato sul luogo di produzione.

Così il valore di U ($= Ue + Ui$) per *l'intero Stato* potrebbe ottenersi per differenza conoscendo il valore di ΣR (potenza dei motori elettrici « mobili ») di meno difficile determinazione. Infatti deducendo dal valore della potenza calcolata con la formula 24 per il *secondo* scopo, $\Sigma P - \Sigma R$ ($= \Sigma Pm + \Sigma E + \Sigma U =$) il valore della potenza determinato con la formula 20 per il *primo* scopo ($M = \Sigma Pm + \Sigma E$) si avrebbe il valore di U. Così, sempre conoscendo ΣR, il valore di ΣU, sarebbe ricavabile dalla differenza fra F ($= \Sigma P$) e O ($= \Sigma P - \Sigma U = \Sigma Pm + \Sigma E + \Sigma R$).

In realtà il valore di ΣU ($= \Sigma Ue + \Sigma Ui$), comprenderebbe un valore di ΣUe decurtato delle perdite per trasmissione a distanza, in confronto al valore di Ui che riguarda la potenza impiegata sul luogo di produzione.

In tutti questi calcoli per differenza giocano poi diversamente i valori delle riserve, che possono essere comprese o escluse.

§ **22.- Differenze fra potenza « teoricamente » utilizzabile e potenza « praticamente» utilizzabile .** — Per passare dalla potenza « teoricamente utilizzabile » a quella « praticamente utilizzabile » occorrerebbe, per le considerazioni svolte nel paragr. 20, ridurre più o meno fortemente i dati di Ei ed Ee (in Svizzera, ad es., del 50% circa : cfr. nota (1) a pag. 18*).

Una riduzione dovrebbe apportarsi al valore di G — caso poco frequente — quando due o più generatori fossero azionati alternativamente dallo stesso motore primario (cfr. pag. 51*).

Ma una notevole decurtazione si dovrebbe applicare per i motori idraulici (cfr. anche paragr. 4, punto C) pag. 18*) dei quali, come per gli altri motori primari, per evidenti ragioni di semplicità e di uniformità nelle rilevazioni statistiche, estese a masse di esercizi grandi e piccoli, ci si deve limitare a richiedere al censito la potenza effettiva indicata dalla targa dei motori o risultante dai dati delle case costruttrici. Ora, la potenza nominale o di targa delle turbine idrauliche delle centrali idroelettriche non può venire quasi mai utilizzata al 100% ed è anzi fortemente inferiore, nella media relativa ad un in-

(1) Salvo il caso piuttosto raro di P maggiore di G (cfr. pag. precedente)

tero Paese. Per una turbina a vapore, invece, la differenza è nulla o quasi.

Queste affermazioni vanno chiarite. Devesi innanzi tutto richiamare il concetto stesso di potenza come *capacità* teorica di produzione cioè di massima quantità di energia che sarebbe teoricamente possibile ottenere qualora il motore o il generatore potesse funzionare in continuazione sviluppando in ogni istante l'energia corrispondente alla potenza effettiva di targa. Nel calcolo della potenza teoricamente utilizzabile si prescinde quindi dall'utilizzazione reale che in pratica si può fare della potenza stessa, cioè del maggiore o minore « lavoro » effettivamente compiuto. Un motore di 1000 CV, che lavori solo un mese all'anno, conta nella statistica in questione come un motore di eguale potenza che lavori dodici mesi all'anno.

Si supponga che tutta l'energia occorrente allo Stato sia fornita da centrali idroelettriche (con turbine idrauliche) sotto forma di energia elettrica e che tutto il macchinario degli stabilimenti sia azionato soltanto da motori elettrici azionati da dette centrali, cioè dall'esterno (*Ee*).

Per ragioni inerenti al regime naturale delle acque (periodi di piena, di magra, ecc.) e alla tecnica delle installazioni idroelettriche — indipendentemente quindi dalle modalità di utilizzazione dell'energia nel corso dell'anno da parte delle industrie consumatrici e indipendentemente, altresì, dalla possibilità materiale dei motori primari di funzionare simultaneamente — la potenza nominale (o di targa) dei motori idraulici è superiore, non solo alla potenza corrispondente all'energia che viene di fatto venduta o assorbita durante l'anno dalle industrie, ma a quella che in realtà si potrebbe produrre sfruttando al massimo ed in ogni istante tutta l'energia idraulica a disposizione dell'impianto idroelettrico (potenza media teorica o *potenza di concessione*). Se le turbine idrauliche fossero costruite con una potenza tale da utilizzare soltanto la portata delle acque di magra — come era la tendenza dei primi impianti idroelettrici — la loro potenza nominale sarebbe eguale alla potenza effettiva, per cui a 100 kW di potenza della turbina idraulica potrebbe corrispondere una potenza eguale dei motori elettrici azionabili in continuazione dalla centrale (salvo le perdite). Se le turbine idrauliche fossero, invece di potenza tale da poter utilizzare la massima portata delle acque, la potenza di targa delle turbine stesse sarebbe molto superiore alla potenza da esse utilizzabile *in media* nel corso dell'anno (e quindi superiore, ad es., alla potenza di targa dei motori elettrici da esse azionabili in continuazione, sempre prescindendo dalle perdite). La realtà si muove tra il limite superiore e quello inferiore in relazione ai perfezionamenti tecnici degli impianti (serbatoi vaste reti di collegamento, lavoro in parallelo, ecc.) in media si può ritenere che *in Italia ad una potenza di targa dei motori idraulici di* 100 *kW corrisponda oggi una potenza praticamente utilizzabile di circa* 50(1). Se, ad es., la potenza di targa dei motori idraulici installati è di 10 milioni di kW, si potrebbe pensare idealmente alla possibilità di produrre, lavorando in continuazione per un anno: 10.000.000 kW × 365 giorni × 24 ore = 87,6 miliardi di chilowattore (anzi 82,3 mil. tenendo conto della perdita di 0,94 nel

(1) Per fissare tale percentuale media — che ha il valore soltanto grossolanamente orientativo — ci si è basati innanzi tutto sul rapporto esistente fra la potenza dei *generatori* delle centrali idroelettriche (con più di 1000 kW che costituiscono oltre il 90% della potenza installata in dette centrali) e la *potenza di concessione*.

Il dato della potenza di concessione pubblicato annualmente dal Ministero dei Lavori Pubblici - Servizio Idrografico (cfr. le pubblicazioni annuali: *La produzione di energia elettrica e la Statistica delle grandi utilizzazioni idrauliche*) risponde abbastanza bene al nostro scopo in quanto rappresenta la potenza teoricamente utilizzabile in relazione alle portate medie (giornaliere) di un lungo periodo di anni ed ai salti nominali corrispondentemente disponibili.

Tale rapporto, negli anni più recenti, è di circa 0,57: riferito ai motori primari, anzichè ai generatori, si riduce a 0,54. Esso è andato diminuendo nel tempo con il perfezionarsi della tecnica delle installazioni, della produzione e distribuzione dell'energia. Nel 1940 era di 0,5626 nel 1927 di 0,6594.

La potenza di concessione non tiene però conto delle perdite di pendenza del canale, delle perdite di caduta dovute agli attriti delle condotte o gallerie forzate adduttrici della portata, nè delle perdite che si verificano all'interno nella turbina (cfr. *Grandi utilizzazioni idrauliche*, citate, « Avvertenze circa il contenuto degli elenchi »): la perdita complessiva sarebbe pari a circa il 20% (cfr. F. TAJANI, cit. pag. 149). La potenza sviluppabile sull'albero della turbina, cioè all'uscita di questa, sarebbe circa 80 in confronto a 100 della potenza di concessione. In altre parole, i dati ufficiali della potenza di concessione sono del 20% circa superiori alla potenza effettiva utilizzabile dal generatore ad esse accoppiato. Quindi la potenza di concessione dovrebbe essere ridotta di detto 20% abbassando il rapporto suddetto da 0,54 a 0,432. D'altra parte vi sono elementi di fatto che tenderebbero ad elevarlo ed altri a diminuirlo. Fra i primi va ricordato che la potenza di concessione sono più spesso inferiori che superiori alle potenze medie disponibili (cfr. G. MORTARA, *Lo sviluppo dell'industria elettrica in Italia*, pag. 311, Milano, 1934, Ed. Società Edison e « *Statistica delle grandi utilizzazioni di energia* », 1925, pag. 11) e, inoltre, che il rapporto calcolato si riferisce agli impianti più importanti (con oltre 1000 kW) e più moderni o modernizzati e che, per contro, negli impianti più antichi e minori (di cui molti installati presso le stesse officine industriali produttrici) il rapporto deve essere superiore. Fra gli elementi che tendono ad abbassarlo potrebbe avere peso il fatto che la potenza installata nelle centrali elettriche non considera la potenza assorbita dalle « eccitatrici » che assorbono dal 5 al 10% della potenza (cfr. « Le grandi utilizzazioni, ecc.» cit. « Avvertenze generali »).

In media quindi possiamo adottare un *coefficiente medio* di riduzione di 0,50. Va rilevato al riguardo quanto Giulio DE MARCHI osservava (cfr. MINISTERO DEI LAVORI PUBBLICI - SERVIZIO IDROGRAFICO, *Statistica delle grandi utilizzazioni*, ecc. cit., pag. 14) con riferimento al 1925: « Per lo sfruttamento della potenza media teorica di circa 2 milioni di cavalli, si troverebbe quindi installato un complesso di motori idraulici, avente la *capacità* di assorbire una potenza idraulica *quasi doppia* ».

passaggio al generatore). In realtà, per le ragioni tecniche sopraricordate, quei motori possono produrre circa 43,8 miliardi di kWh (anzi 41,2 per tener conto delle perdite nel passaggio al generatore (1).

Ciò significa che con una potenza nominale o di targa dei motori idraulici di 100 si potrebbero far lavorare *in continuazione* motori elettrici — in Italia almeno — con una potenza di 50. (In realtà, la loro potenza dovrebbe essere minore per tener conto di circa il 30% delle perdite, quindi i motori elettrici riceverebbero una potenza pari a 35 : questa dovrebbe essere la potenza nominale che, nei nostri calcoli, si potrebbe teoricamente attribuire a detti motori elettrici).

Un motore primario a vapore, invece, può teoricamente essere alimentato in continuazione tutto l'anno con il vapore prodotto dalle caldaie ; tutta la potenza indicata dalla targa dei motori può, cioè essere utilizzata. Per ritornare all'esempio di prima, i 10 milioni di kW dei motori primari a vapore possono teoricamente dare (escluse le perdite) quegli 87,6 miliardi di kWh all'anno, che i motori idraulici non possono fornire che per metà. Teoricamente quindi i motori a vapore potranno azionare motori elettrici con una potenza di targa di 10 milioni di kW (salvo la deduzione per le perdite di potenza e delle riserve) (2).

Pertanto se nello Stato *A* i 10 milioni di kW di potenza di motori primari fossero rappresentati da motori idraulici e nello Stato *B* da motori a vapore, la potenza praticamente utilizzabile dello Stato *A* dovrebbe considerarsi — a parità di ogni altra circostanza — pari al 50% di questa. Nel caso di un motore primario *idraulico* di potenza *P* la cui energia viene tutta destinata a produrre energia elettrica venduta per azionare motori elettrici (*Ee*) si avrebbe, a prescindere dalle perdite, $Ee = \frac{1}{2}$ di P; cioè $P = 2\ Ee$, mentre per i motori a vapore sarebbe $P = Ee$.

In uno Stato i motori primari sono, in realtà, in parte idroelettrici, in parte a vapore, a nafta, ecc. : sommando quindi la potenza di targa di tutti i motori primari (*P*) si ottiene una potenza installata superiore a quella utilizzabile e di tanto maggiore, quanto maggiormente sono rappresentati i motori idraulici in confronto agli altri.

§ 23. - Potenza di riserva e inattiva. — Si è finora, di proposito, trascurata nei nostri calcoli la potenza dei motori di riserva. Se si ha cura di richiedere nei questionari di censimento il numero e la potenza dei motori e generatori in riserva si possono determinare tre dati (con una o l'altra delle formule indicate) :

a) potenza installata complessiva (compresa la riserva) ;

b) potenza in riserva ;

c) potenza « attiva » (esclusa la riserva : *a*) meno *b*).

In alcuni Stati si preferisce calcolare e pubblicare il solo dato della potenza « attiva », in altri la potenza complessiva. La differenza fra un dato e l'altro può essere sensibile. Nei singoli stabilimenti la differenza può arrivare al 100% (quando, ad es., per ogni motore attivo s'installi un motore di riserva di uguale potenza) (3).

Sebbene sia sempre consigliabile richiedere nel questionario di rilevazione i dati della riserva — per poter disporre di dati utili allo studio di tutte le questioni connesse con la nostra materia — non è sempre facile ottenere risposte attendibili. Ciò accade, in particolare, quando si richiedano :

a) dati dei motori primari azionanti direttamente il macchinario (criterio *B*). Sorgono difficoltà per i casi, non infrequenti, di motori primari che azionano ad intermittenza, o alternativamente, macchinario e generatori elettrici (4). Per i singoli motori *attivi* la divisione della potenza fra i due usi si potrebbe compiere — secondo le raccomandazioni dell'Istituto Internazionale di Statistica — in parti proporzionali alla durata media di utilizzazione per l'uno o per l'altro uso (supponendo cioè una parità di carico). Analogo criterio dovrebbe compiersi per la potenza dei *corrispondenti* motori in riserva. Senonchè, come si è già rilevato, è difficile otte-

(1) In Italia, ad es., 4600 milioni di kW dei generatori delle centrali idroelettriche (con potenza superiore ai 1000 kW) hanno prodotto 15,8 miliardi di kWh, pari a circa il 40% della energia idealmente sviluppabile lavorando in continuazione per tutto l'anno. Questa percentuale può però dipendere dalla mancata utilizzazione totalitaria della energia da parte delle industrie. Se si prescinde da questa circostanza di fatto, in realtà le centrali idroelettriche potrebbero produrre di più.

(2) In altre parole se fosse possibile rendere uniforme per tutta la durata dell'anno la portata delle acque, in modo da avere un deflusso continuo e costante ad ogni istante — così come si può immaginare sia continuativa e costante, agli effetti del nostro calcolo, la quantità di energia termica (carbone, nafta, ecc.) che alimenta un motore a vapore o a combustione interna — la potenza di targa dei motori idraulici sarebbe la metà di quella che si riscontra nella realtà.

(3) È molto più frequente che il caso si verifichi per i motori primari che per i motori elettrici pei quali in pratica si fa raramente una riserva.

(4) Nel censimento italiano del 1927 si chiese al censito di indicare separatamente, da una parte, il numero e la potenza dei motori primari azionanti direttamente il macchinario e *la relativa riserva*, e, dall'altra, quelli azionanti generatori elettrici e la relativa riserva. Si ritiene che i risultati siano stati poco soddisfacenti se, negli spogli, si ritenne conveniente di indicare in una unica cifra la riserva complessiva dei motori primari dell'una e dell'altra categoria.

nere dal censito la suddetta divisione per i motori attivi (1) e ancor più lo è per quelli in riserva, quando in uno stabilimento siano installati più motori primari con diversa destinazione (per azionare esclusivamente il macchinario, e per azionare esclusivamente il generatore, per uso promiscuo).

b) i dati dei motori elettrici azionati dall'esterno (criterio *A*). Poichè, come si è osservato, possono essere installati nello stabilimento motori azionati promiscuamente dall'interno e dall'esterno, anche qui non è facile, per il censito, di indicare la potenza di riserva da attribuire ai motori azionati dall'interno e dall'esterno, o quelli azionati promiscuamente (1). La divisione della riserva in parti proporzionali potrebbe dar luogo, in alcuni casi, a contrasti con la realtà.

Ma difficoltà sorgono, sopratutto, circa la definizione di « riserva ». Nel censimento italiano del 1927 nessuna norma venne data al riguardo. Nel censimento del 1937-40 venne indicato, nello stesso questionario di rilevazione che « per motori di riserva » si intendessero « quelli che sono installati allo scopo di essere azionati solo in caso di mancato funzionamento, per qualsiasi causa, degli altri motori ». (Dagli spogli eseguiti non sembra che tale norma sia stata sempre uniformemente interpretata).

Gli è che si possono distinguere due tipi di « riserva » :

1) *Riserva « tecnica »*, cioè :

a) motori o generatori da utilizzare solo in caso di guasti improvvisi o di riparazioni, o, in genere, di arresto dei motori normalmente in funzione.

Sorge qui la questione se si debbano o meno considerare come riserva « tecnica » anche i motori che funzionano normalmente nelle sole ore di punta o di *sovraccarico* per far fronte a domande momentanee (ciò che può verificarsi anche quotidianamente) (3) od eccezionali. Alcuni Paesi li considerano fra i motori « attivi » (come, ad es., in Germania e Stati Uniti d'America) ed altri fra i motori in riserva (4) ;

b) motori con potenza massima utilizzabile, molto superiore a quella installata. Motori elettrici accoppiati a macchine che lavorino alternativamente (anche nel corso della stessa giornata) possono essere installati, come abbiamo visto al paragrafo precedente, con potenza doppia, tripla, quadrupla, di quella utilizzabile (cioè di quella corrispondente alla potenza del generatore che li aziona). Anche un motore che lavori normalmente ad una potenza inferiore alla potenza effettiva può considerarsi come avente, in sè stesso, una riserva tecnica. In ogni caso si tratta di motori che il censito non può considerare come riserva, in quanto possono essere in azione *normalmente*, quotidianamente, per un certo numero di ore, ma non contemporaneamente agli altri (5). La rilevazione di questa particolare riserva tecnica è praticamente impossibile.

2) *Riserva economica.*

Cioè riserva dipendente da ragioni « economiche » : motori o generatori che non vengono utilizzati per ragioni di congiuntura. Ciò si verifica, ad es., quando il censimento cade in un anno di crisi o di rallentata attività economica, o quando, per contro, si installano nuovi motori o generatori in previsione di sviluppi a breve scadenza negli impianti e macchinari dello stabilimento (6).

Se non vengono date ai censiti chiare istruzioni può accadere che alcuni considerino la potenza dei motori inattivi per ragioni economiche come po-

(1) In Germania — dove si usa per il calcolo della potenza installata il criterio (*B*) — si chiede nel questionario di dare, per ciascun motore primario *attivo*, la divisione della sua potenza (in CV) in due parti a seconda che serva « regolarmente » come potenza motrice di macchine da lavoro o come « generatrice di elettricità », ma non risultano stampate nel questionario (cfr. *Gewerbliche Betriebszählung*, 1933, Band 462,1, pag. 1-17 ; 1-20, 1-22) norme per il caso che lo stesso motore attivo serva promiscuamente ai due usi. È detto soltanto nelle note illustrative (pag. 1-9, nota 1) che in tal caso la divisione si compie in modo analogo. Come si sia regolato il censito in questi casi non è dato di sapere. Nè si può conoscere se questo uso promiscuo abbia una portata pratica o si riferisca, nel complesso, a potenze trascurabili.

Il dato della potenza in riserva è stato poi chiesto complessivamente per i motori primari, senza cioè la suddetta duplice distinzione nè si accenna a divisioni della potenza in riserva in parti proporzionali (in base alla potenza *attiva* destinata rispettivamente ad azionare il macchinario od i generatori) in quanto il calcolo della potenza installata viene limitato alla potenza attiva o utilizzata (escluse le riserve).

(2) Nei censimenti del 1937-40 gli esperti incaricati della compilazione dei questionari di censimento hanno ritenuto opportuno limitarsi a chiedere i motori elettrici di riserva, in complesso, senz'altre indicazioni.

(3) Come accade, ad es., di frequente nelle centrali elettriche, per gli impianti termo-elettrici che funzionino più spesso nelle ore di punta per aumentare il fattore di utilizzazione dell'impianto.

(4) Personalmente si ritiene che tali motori *non* debbano essere considerati in riserva, costituendo degli integratori dei motori attivi e funzionando contemporaneamente a questi e non in loro vece (cfr. *allegato*).

(5) A proposito di riserva va considerato che *nelle moderne centrali* idroelettriche con serbatoi idrici artificiali, con estese reti di distribuzione in parallelo, le *riserve tendono a ridursi a zero*, e la norma che imponeva una riserva di un terzo della potenza non ha più ragione di essere. Va a questo proposito considerata la particolare circostanza in cui si trova il nostro Paese, di centrali riceventi acqua dai corsi alpini, a magra invernale, i quali possono venire in aiuto delle centrali servite da corsi di acqua appenninici a magra estiva : *ogni centrale funziona così, in alcuni periodi, come riserva di tutte le altre.*

(6) L'Istituto Internazionale di Statistica nella raccomandazione votata nel 1936 ad Atene si limitava a proporre « Si distingueranno, se *possibile*, i motori in *servizio normale*, anche se momentaneamente non impiegati per ragioni economiche, e i motori *in riserva*, che non servono se non in circostanze eccezionali ».

tenza « in riserva » ed altri censiti no. Così dicasi per i motori che funzionano nelle ore di punta (riserva tecnica di cui al punto *a*) (1).

In materia di riserva « economica » il concetto di « riserva » si confonde con quello di « *inattività* » (totale, prevalente, parziale) e la questione diventa importante, quando, come si fa spesso, si vogliano calcolare i coefficienti caratteristici sulla potenza in CV per operaio o per addetto (2).

Occorrerebbe quindi definire anche il motore « inattivo » (o prevalentemente attivo, ecc.) creando complicazioni — votate preventivamente all'insuccesso — che difficilmente potrebbero risolvere la questione (cfr. nota (1) a pag. precedente).

Possono anche sollevarsi dubbi, in occasione degli spogli, sulla inclusione o meno della potenza relativa ai motori o generatori installati negli esercizi *inattivi* alla data (o nell'anno) di censimento (3).

* * *

La questione della potenza in « riserva » è poi complicata dal *diverso significato che in pratica si viene fatalmente, ad attribuire alla riserva dei motori*

(1) In *Germania* si considerano attivi (*non* in riserva) tanto i motori della riserva « economica » quanto i motori che funzionano soltanto nelle ore di punta o di sovraccarico.

Nel censimento germanico del 1933 erano date le seguenti istruzioni « sono considerate in riserva le macchine che, per il funzionamento normale dell'azienda vengono impiegate soltanto quando le altre macchine dell'azienda stessa sono temporaneamente inattive a causa di difetti, interruzioni di corrente ecc. Invece le macchine motrici che servono a coprire il fabbisogno giornaliero od altro bisogno di « punta » (*Spitzenbedarf*) non debbono essere indicate come riserva. Egualmente non debbono essere considerate in riserva le macchine temporaneamente inattive a causa di restrizioni aziendali ». (Cfr. « Statistik des Deutschen Reichs », Band 462, I, *Gewerbliche Betriebszählung*, 1933. Berlin, 1935, pag. 1-22).

Negli *Stati Uniti d'America* si chiede al censito di fornire, in un'unica cifra : la potenza dei motori (primari od elettrici) e dei generatori « attivi ed emergenti » (si considerano « emergenti » quelli che possono essere messi in funzione prontamente, ma che sono usati : o soltanto in caso di guasti dei motori attivi oppure quando, *eccezionalmente*, vi è un carico eccezionale cui far fronte) e si richiede poi — soltanto per i motori primari e per i generatori — la potenza che non è *ordinariamente* attiva e i CV (o kW) corrispondenti.

Nel *Regno Unito*, ad es., nel quarto censimento del 1931 (riferito al 1930), la distinzione fra motori attivi e in riserva era basata sul concetto di considerare attivi (« normalmente in azione ») quelli azionati durante la *maggior parte dell'anno*, anche se non lavorarono, a piena capacità ; « *in riserva o inattivi* » gli altri (Cfr. par. 4, pag. 19*).

(2) Questo coefficiente (CV per operaio o per addetto) viene infatti a perdere ogni significato concreto quando si facciano, ad es., confronti fra i risultati di due censimenti, uno eseguito in anni normali ed un'altro in anni di crisi, perchè ad una potenza installata (comprendente le riserve economiche) *x* rimasta ad es. invariata nei due censimenti, corrisponde nel secondo censimento in numero di CV per operaio molto più elevato solo perchè, in seguito alla crisi, si è ridotto il numero degli addetti. Vedasi, ad es., quanto è accaduto in Germania per i confronti fra il censimento del 1925 e quello del 1933 (cfr. pubblicazione citata, pagine 1-9) : « Il concetto di macchine in riserva non ha subito modificazioni nel censimento industriale 1933 rispetto a quello del 1925. Modificandosi però la situazione economica è cambiato il significato dei dati relativi alle macchine in riserva e alle macchine motrici « attive ». Nell'anno 1925 le aziende lavoravano quasi tutte in pieno e le macchine motrici esistenti funzionavano effettivamente, salvo le unità tenute in riserva anche a funzionamento normale. Facendo un confronto tra potenza delle macchine motrici destinata alla mozione di macchine da lavoro e persone occupate, si poteva perciò calcolare il grado di motorizzazione per i singoli rami industriali e per classi di ampiezza delle aziende. I dati rilevati per l'anno 1933 sulla potenza delle macchine motrici attive contengono però anche dati sulla potenza di macchine temporaneamente inattive a causa della situazione economica. Del resto lo sfruttamento medio delle macchine motrici effettivamente utilizzate sarà stato molto più basso nel 1933 che nel 1925. I risultati statistici sulla potenza del censimento industriale 1933 danno perciò unicamente un quadro delle macchine motrici esistenti nei singoli rami industriali e della loro potenza ».

« Come misura per la potenza motrice delle aziende i dati rilevati nel 1933 sull'impiego delle macchine motrici

segue nota 2.

hanno senza dubbio, una grande importanza. Essi non possono, però, come nel 1925, essere messi in rapporto al personale occupato, e in particolare si deve rinunciare a calcolare il grado di motorizzazione e a stabilire, mediante confronti, gli effetti delle misure adottate dopo il 1925 sul rapporto tra uomo e « potenza » delle macchine. Nei lavori preliminari per il censimento industriale 1933 fu esaminato se questa mancanza non potesse essere eliminata mediante ampliamento o cambiamento delle domande. Queste ricerche però rimasero senza risultato positivo. Sarebbe stato possibile senz'altro ai dirigenti delle aziende rilevare a parte il numero di macchine inattive a causa della crisi economica assieme alla loro potenza. Invece sembrava impossibile di rilevare in modo approssimativo il regresso causato dalla crisi nel grado di utilizzazione delle macchine impiegate, poichè già ad andamento normale dell'azienda le macchine non sono sempre pienamente utilizzate a causa delle particolarità tecniche della produzione. Il problema, quale parte della minore utilizzazione, di una macchina è dovuta ad esigenze generali dell'economia o ad altre inerenti alla tecnica dell'azienda, non si può risolvere con la rilevazione statistica, ma soltanto attraverso ricerche particolari. Date queste difficoltà si doveva perciò rinunciare, nel censimento industriale 1933, ad una applicazione del metodo di rilevazione statistica della potenza, alla modificata situazione economica ».

Del resto anche il confronto dei coefficienti suddetti in anni normali non è così significativo come a prima vista si può credere per l'eterogeneità dei dati messi a confronto : da una parte la potenza installata, che può rimanere fissa tutto l'anno e per più anni e che indica soltanto di una « capacità » *potenziale* di produzione e dall'altra il numero di operai che varia durante l'anno e da un anno all'altro in base alla produzione *effettiva*. Ancora più irrazionale è il confronto quando si calcoli il coefficiente in base agli operai addetti in un *giorno* di censimento. La stessa « potenza » può essere sfruttata durante l'anno, diversamente, cioè i motori possono « lavorare » per un maggiore o minore numero di ore nei diversi rami di industria posti a confronto in un determinato anno o in anni successivi. (Ciò sta a indicare anche come il calcolo più razionale, sia quello fra *chilovattora* e ore di lavoro della mano d'opera (Cfr. par. 1, pag. 3*).

La durata dell'utilizzazione del motore entra quindi come importante elemento perturbatore e ciò spiega, ad es., come nel Regno Unito si sia data la norma di considerare « attivi » soltanto i motori in azione durante la maggior parte dell'anno. (Cfr, nota (1) a pagina precedente e par. 4). Ma anche questa norma è di incerta applicazione in quanto un motore che viene azionato due ore al giorno tutti i giorni (730 ore all'anno), sarebbe considerato attivo mentre un motore in azione 24 ore al giorno, per quattro mesi (2.880 ore all'anno) verrebbe considerato inattivo.

(3) La questione assume notevole importanza per le statistiche degli autoveicoli : autoveicoli in circolazione — cioè « attivi » — e autoveicoli inattivi (anche se, ad es., inscritti nel pubblico registro automobilistico) nell'anno di censimento.

primari, in confronto a quella dei motori elettrici. Questi, abbiamo detto più volte, possono essere installati per una potenza doppia, tripla, quadrupla, della potenza normalmente assorbibile: la diffusione di macchine, utensili ed attrezzi « elettrici » di ogni genere accentua sempre più questa sproporzione. Senonchè, come si è già detto, nessun censito oserà considerare in riserva dei motori elettrici che servono durante l'anno ad un lavoro preciso, anche se per un tempo limitato. Ciò non accade per i motori primari (1).

Non va trascurata a questo riguardo l'osservazione che la proporzione della potenza in riserva è, *in complesso* — secondo i dati rilevati dai censimenti — superiore per i motori primari che per i motori elettrici.

Occorrerebbe quindi introdurre il concetto di *potenza media utilizzata o assorbita* (cfr. paragr. 4) che è di applicazione pratica estremamente difficile e che è in contrasto con le premesse (2).

La difficoltà di rilevare i dati sulle riserve rende anche meno significativi i dati statistici sulla potenza installata « attiva ». In conclusione le difficoltà di rilevare, sia pure in modo approssimativo, la potenza in riserva con criteri corretti e inequivocabili, l'incertezza del suo significato a seconda che si tratti di motori primari o di motori elettrici, *consigliano* — specialmente per i confronti nel tempo e fra Stato e Stato — di dare la preferenza al calcolo della potenza installata complessivamente, comprese le riserve (3).

Circa la difficoltà di definire le riserve negli impianti elettrici e sulla diversità di criteri adottati dai diversi stati al riguardo. G. MORTARA (*Sulle statistiche degli impianti elettrici* in *Revue de l'Institut International de Statistique*, 2 année, Livraison 4. La Haye, 1934, pag. 380-381-382) osservava quanto segue: « Molti impianti dispongono di macchinario di riserva, nel senso più ristretto di questa espressione, cioè di macchine destinate a surrogare quelle normalmente in uso, quando queste non siano in grado di funzionare. Un impianto idroelettrico, ad esempio, potrà disporre di un gruppo idroelettrico di riserva nel senso sopra indicato. Oppure potrà disporre di riserve termoelettriche, cioè di gruppi azionati da motrici a vapore, a combustione interna, ecc., destinati a consentire la produzione di energia elettrica anche quando, per conseguenza di una siccità o di altra causa, faccia difetto l'energia idraulica. L'impianto termoelettrico di riserva, se è completo, potrà funzionare in sostituzione, parziale e totale, dello impianto idroelettrico, ma anche

---

(1) Ciò spiega l'apparente contraddizione fra l'esistenza di una potenza dei motori elettrici molto esuberante in confronto ai bisogni ed alla effettiva utilizzazione — con la conseguenza di rilevare dai censimenti una potenza installata dei motori elettrici (e quindi anche quella totale) molto superiore alla reale — e il fatto che la potenza in « riserva » dei motori elettrici è denunciata dai censimenti in proporzioni minori rispetto a quello dei motori primari.

Non solo, ma per i motori elettrici la proporzione, anzichè aumentare (con l'estendersene dell'uso) va diminuendo di censimento in censimento.

Così in Italia, per le industrie alimentari e chimiche (per le quali soltanto sono stati fatti gli spogli completi) la percentuale dei motori elettrici in riserva rispetto alla potenza totale utilizzabile scende dal 15,2 nel 1927 al 7,8% nel 1937-38. Per le singole classi di industria si aveva nel 1927, il 12,3% nelle meccaniche; 10,3% nelle tessili; 12,4 per cento nelle siderurgiche.

In *Germania*, per le industrie, la percentuale passa dal 14,5% nel 1925 all'11,7% nel 1933.

Nel *Regno Unito* (per tutte le industrie eccetto le industrie elettriche) scende dal 13,8 al 12,4%.

La percentuale di potenza in riserva è molto maggiore per i motori primari che per i motori elettrici. Così in Italia troviamo, per le due classi di industria prima indicate, il 20,2% nel 1927 e il 18,1% nel 1937-38. Per le singole classi d'industria si avevano nel 1927, il 52% nelle industrie meccaniche; 42,1% nelle tessili; 32,2% nelle siderurgiche. In Germania, nelle industrie di produzione di energia elettrica, gas e acqua, la percentuale è del 28,3% nel 1925 e del 18,8 nel 1933. Nel Regno Unito (per tutte le industrie, eccetto l'industria elettrica) si trova il 16,2% nel 1924 e il 19,3 nel 1930. Per i generatori la percentuale di riserva sembra essere ancora maggiore: così troviamo nel Regno Unito il 28,2% nel 1924 e il 30,1% nel 1930. In Germania, in tutte le attività economiche (industriali e non) eccetto l'industria elettrica (gas e acqua) la percentuale è del 35,2% nel 1925 e del 30,4% nel 1933; per la industria elettrica del 29,1% nel 1925 e del 18,5% nel 1933.

La diversità di queste percentuali dà maggiore consistenza alla ipotesi della notevole varietà di criteri seguiti nei diversi Paesi (e nello stesso Paese nel corso del tempo) per definire le riserve, alle quali può essere dato un diverso significato a seconda che si tratti di motori primari o di motori elettrici.

(2) M. HUBER nell'introduzione al volume « Statistiques des forces motrices en 1926 (pag. 14) osservava: « On peut, dans une certaine mesure, préciser cet indice en di-

segue nota 2.

stinguant *les moteurs en service normal* et les *moteurs en réserve*, ce que l'on fait dans certains pays.

Cette distinction est parfois très nette: par exemple une usine qui utilise une chute d'eau a un moteur à vapeur ou à gaz, qui ne sert qu'en cas d'insuffisance du débit de la rivière; une imprimerie de journaux dont les moteurs sont alimentés par le secteur électrique a un groupe générateur (moteur à vapeur, dynamo) en réserve pour parer aux « pannes » possibles de la distribution publique d'électricité, etc.

Mais dans beaucoup de cas, les moteurs sont mis en service suivant l'activité des fabrications, si elle est très variable, *la distinction des moteurs en réserve devient assez arbitraire.* D'autre part, les moteurs considérés comme en service normal ne sont eux aussi utilisés que pour une part variable de leur puissance normale.

En réalité, si l'on veut, non pas seulement un indice de la capacité de production, mais un indice des fluctuations de la production, ce n'est pas la *puissance* installée qui convient, c'est l'*énergie* consommée. Ainsi, pour être renseigné sur l'activité productrice, il faudrait, à défaut de données directes sur la production en quantité ou en valeur pendant une durée déterminée, avoir la consommation des combustibles, de l'électricité, etc., pendant cette durée ».

(3) Anche sotto questo aspetto l'uso del criterio (*C*) — che equivale al (*B*) — è preferibile, perchè evita ogni sorta di giudizi personali del censito sui dati da dichiarare e sui calcoli proporzionali da compiersi (sia per i motori attivi che in riserva).

simultaneamente ed a rinforzo di esso. Ecco presentarsi un diverso concetto di « riserva », riguardandosi come tale anche quel macchinario che viene impiegato solo in via straordinaria per far fronte ad eccezionali « punte » della domanda di energia elettrica. D'altra parte, la variabilità della potenza idraulica disponibile, attraverso il ciclo annuale, induce talora le imprese ad installare nei loro impianti una quota di macchinario che può essere impiegata soltanto in quella parte dell'anno in cui è più copiosa la portata disponibile ; in confronto al macchinario che può essere impiegato costantemente, questa quota assume, in un certo senso, il carattere di « riserva » destinata ad utilizzare le « punte » della disponibilità di energia idraulica (punte che, con la regolazione dei deflussi, possono in parte essere determinate artificialmente per far fronte a punte della domanda senza ricorrere al sussidio termoelettrico). La distinzione tra i vari tipi di riserva spesso non sussiste di fatto, perchè le stesse macchine possono assolvere le diverse funzioni ; *è quindi pressochè impossibile delimitare nella rilevazione statistica l'estensione dei vari tipi.* In alcuni paesi, come in Italia ed in Francia, il macchinario di riserva è compreso nella rilevazione della potenza installata ; in altri paesi, come nel Canadà, n'è escluso : possono riuscire al riguardo istruttive le avvertenze espresse nelle statistiche canadesi. . . . . Appare chiara da queste complicate avvertenze, che pur confessano l'impossibilità pratica di raggiungere il fine, *la difficoltà di una precisa separazione del macchinario di riserva da quello di impiego normale* ».

Va anche considerato che dal punto di vista della « capacità » potenziale, teorica, massima, di produzione, conta come « potenza » nominale tanto quella dei motori « attivi » quanto quella degli « inattivi » quanto quella dei motori in riserva. Si tratta cioè di « installazioni » nelle quali i motori installati nello stabilimento hanno un significato in quanto presi nel loro insieme, cioè con le loro riserve, dosate queste e regolate in funzione di complessi elementi variabili da stabilimento a stabilimento, da tecnologia a tecnologia.

§ 24. - I « trasporti » nel calcolo della potenza utilizzabile. — Abbiamo già accennato (cfr. paragr. 6 punto *E*) le ragioni che militano in favore del calcolo separato della potenza dei « trasporti » intesi, tanto come « mezzi di trasporto » motorizzati in genere (che esistono in ogni ramo di attività economica — agricoltura, industria, imprese di trasporto, commerci, ecc. — e non economica : uffici pubblici, aziende domestiche, ecc.) quanto come una particolare branca dell'attività esercitata dalle « imprese di trasporto propriamente dette » (branca che non può considerarsi come un'industria vera e propria, ma semplicemente come un « servizio ») da censire e da spogliare a parte. Ciò anche in conformità alle raccomandazioni fatte al riguardo dall'Istituto Internazionale di Statistica (1).

Qualunque sia il significato che si voglia attribuire ai « trasporti » l'inclusione o l'esclusione dai nostri calcoli della potenza loro attribuibile ha dato luogo ad equivoci od imprecisioni di calcolo od errori dovuti, essenzialmente, alla mancanza di precisazioni degli scopi che si vogliono raggiungere, e cioè, del concreto significato da attribuire ai risultati ottenuti.

Incertezze ed equivoci derivano anche — come si è pure accennato al paragrafo 6 punto *E* — dalla esistenza e dal crescente sviluppo della trazione elettrica : se questa non esistesse gran parte di detti equivoci cadrebbe. Mentre per i mezzi di trasporto motorizzati « autonomi » (automezzi a vapore, a benzina, a nafta, a gas, ecc.) non esiste che il motore primario (che si muove nello spazio con

---

(1) La raccomandazione è così formulata : « La statistica delle forze motrici deve essere stabilita *separatamente* per i trasporti (non compresi i trasporti all'interno degli stabilimenti industriali) : *a*) trasporti su strada : automobili, trattori, ecc.; trasporti ferroviari : locomotive, automotrici, *motori fissi per la trazione elettrica*, funicolari, teleferiche, ecc.; *c*) trasporti per via d'acqua : battelli a vapore, a motore, ecc.; *d*) trasporti aerei : aeroplani, dirigibili, ecc. Per le automobili si indicherà se si tratta di potenza convenzionale o di potenza reale » (Cfr. *Bulletin ecc.*, Tome XXIX, 3e livr., 1936, citato, pag. 219). L'indicazione dei motori fissi per la trazione elettrica deve essere inclusa anche pei trasporti elettrici su strada (filobus).

Il criterio seguito dall'I.I.S. di indicare, per i mezzi di trasporto elettrici (trazione elettrica), la potenza dei motori « fissi », anzichè quella dei motori « mobili » azionanti mezzi di trasporto, sembra abbia lo scopo di esprimere la potenza complessiva di tutti i mezzi di trasporto, in termini di potenza *primaria*. Criterio che appare fuori luogo dato che non è stato seguito affatto per la potenza destinata ad usi diversi dai trasporti. Se il criterio fosse stato, invece, suggerito dal fatto che la potenza dei motori elettrici dei mezzi di trasporto elettrici è molto superiore alla potenza primaria dei motori fissi che li azionano (in Italia ad es. nel rapporto da 1 a 4 o da 1 a 5) si osserva che tale eccedenza di potenza è dovuta al fatto che le imprese di trasporto (specie le ferrovie) per necessità fondamentali della circolazione dei mezzi di trasporto debbono avere a disposizione una massa notevole di mezzi con potenza di molto superiore a quella effettivamente e praticamente « utilizzata » : il grado di utilizzazione cioè di « ore » (giornaliere o annuali) di lavoro utile effettivo (per i trasporti) è molto basso in confronto alle ore teoriche (ciò, come si è visto, accade anche, in misura minore, per i motori elettrici « fissi »). Ma questa circostanza di fatto è comune anche ai mezzi di trasporto non elettrici (locomotive a vapore, a combustione interna) e non vi è ragione di usare un trattamento diverso soltanto nei riguardi dei motori elettrici « mobili » dei mezzi di trasporto : i dati calcolati in base al criterio suggerito dal l'I.I.S. sarebbero eterogenei e quindi non sommabili.

Era sufficiente, invece, a nostro avviso, avvertire che, soltanto nel caso in cui si debbano sommare i dati della potenza dei motori « fissi » (o parte di essi) con la potenza dei mezzi di trasporto (cioè per gli scopi terzo e quinto del nostro studio), non si deve comprendere fra la potenza di motori « fissi » quella destinata alla trazione elettrica (cioè il valore di *R*). Non è d'altronde sempre possibile isolare questa potenza (vedi avanti, nel testo).

il veicolo che esso aziona: motore «mobile») nei mezzi di trasporto elettrici — che sono costruiti per l'identico scopo (spostamento e trasferimenti di persone e di merci, nello spazio) e che compiono l'identico servizio — esistono, da una parte, il motore primario «fisso» solidamente installato (in una centrale elettrica o negli stessi locali dell'impresa di trasporto) e dall'altra i motori secondari, elettrici, «mobili» di potenza supposta eguale a quella del motore primario che li aziona (e al quale sono uniti con i fili della rete di alimentazione della energia elettrica).

Ne derivano due fonti di equivoci. Da una parte la tendenza a considerare i motori *primari* «mobili» dei mezzi «autonomi» (automobili, ecc.) alla stessa stregua dei motori *secondari* (elettrici) dei mezzi di trasporto elettrici (anch'essi «mobili» e adempienti, l'identica funzione fino ad essere intercambiabili come accade da noi) senza tener conto dell'esistenza della corrispondente potenza, all'origine, del motore primario «fisso». Dall'altra parte, vi è la tendenza a non isolare dagli altri motori primari «fissi» — come sarebbe necessario per evitare duplicazioni — i motori primari «fissi» destinati a fornire energia elettrica per la trazione elettrica: trattandosi di motori identici a quelli che azionano i macchinari o che forniscono energia destinata a scopi di illuminazione, riscaldamento, ecc. è facile equivocare (1). In altre parole si possono effettuare talvolta duplicazioni di calcolo: una volta considerando la potenza del motore primario «fisso» e un'altra volta quella (equivalente) del motore elettrico «mobile» azionato, commettendo così uno degli errori più gravi in materia.

Ciò premesso vogliamo qui accennare ad altri aspetti della questione. Innanzi tutto per il calcolo della potenza *globalmente* installata nello Stato per qualsiasi uso, compresi i trasporti (terzo scopo, cfr. paragr. 13) occorrerebbe determinare innanzi tutto, come sappiamo già, la potenza di *tutti* i motori *primari* (L) dei mezzi di trasporto (terrestri, aerei o per via d'acqua). Si dovrebbe quindi fare un vero e proprio *censimento completo dei mezzi di trasporto esistenti*. Tale censimento (od anche soltanto quello di tutti i mezzi di trasporto non elettrici) urta in pratica contro difficoltà notevoli (2).

Ciò ha costituito, in pratica, un motivo di più (cfr. paragr. 6) per escludere dal calcolo della potenza globalmente disponibile in uno Stato quella dei mezzi di trasporto. Ma, se è facile eliminare dal calcolo gli automezzi autonomi più difficile è l'eliminazione dei mezzi di trasporto elettrici, qualora si voglia fare riferimento alla potenza globale dei motori *primari* destinati a produrre energia per trazione elettrica.

I motori (e generatori) di grandi centrali elettriche possono produrre infatti energia destinabile a tutti gli usi e non è sempre facile determinare, sia pure a calcolo, quanta parte della loro potenza si possa attribuire alla trazione elettrica. Le difficoltà maggiori si riscontrano quando vi sono stabilimenti industriali che producono energia elettrica che serve in parte anche per gli usi dello stesso stabilimento industriale, spesso alternativamente nel corso dello stesso giorno. Casi tipici sono quelli delle industrie dei soffioni boraciferi, delle miniere di carbon fossile delle cokerie (che traggono l'energia dal gas dei forni a coke), delle miniere che gassificano ligniti e torbe sul posto per produrre vapore ed energia elettrica (3).

---

(1) Nei locali delle stesse «imprese di trasporto» due motori primari identici possono azionare ad es. generatori elettrici destinati, uno a fornire energia per la trazione elettrica e l'altro, invece, per azionare macchinari (di officine di riparazione ad es. o per illuminazione, riscaldamento ecc.). Anzi lo stesso motore e relativo generatore potrebbero servire ai due diversi scopi.

(2) Normalmente si eseguono in Italia solo censimenti *parziali* dei mezzi di trasporto in occasione dei censimenti industriali inserendo nei questionari di rilevazione appositi quesiti sui mezzi di trasporto in dotazione agli esercizi censiti (comprese fra questi generalmente le imprese di trasporto). Si raccolgono inoltre elementi utili valendosi di statistiche tratte da fonti amministrative (da noi, ad es., quelle del RACI, del Registro navale, della Marina mercantile, ecc.) o fiscali. Le une e le altre forniscono però dati incompleti, non sempre corretti, che permettono soltanto di compiere integrazioni congetturali, e sempre parziali dei dati di censimento. In ogni caso sono esclusi dalla statistica i motori degli automezzi militari e delle macchine di guerra: terrestri, marittimi, aerei. Un censimento vero e proprio è teoricamente concepibile, ma non risulta che sia stato, finora, eseguito. Per farlo si dovrebbero eseguire — come si fa in Germania — censimenti totalitari, estesi cioè, contemporaneamente, ai singoli cittadini (in occasione ad esempio dei censimenti demografici) alle imprese di trasporto, ai commerci, agli uffici pubblici, agli istituti di educazione, ecc., con l'avvertenza di inserirci questionari di censimento e domande dettagliate sui mezzi di trasporto.

(3) LEPRINCE-RINGUET (Cfr. *Bulletin, cit.*, pag. 101) nel proporre che le statistiche sulle forze motrici siano sempre accompagnate da una statistica sulle destinazioni dell'energia (in kWh) venduta — usi elettrochimici ed elettrotermici; luce; forza motrice — osservava: «si segnala a questo riguardo, che la vendita di energia elettrica ha una grandissima importanza, nelle centrali delle miniere in particolare, specialmente in Francia e in Germania. La principale fonte di energia (il gas dei forni a coke) essendo sensibilmente costante, si utilizzano colà le *stesse* generatrici per la vendita all'esterno in alcune ore del giorno e per i bisogni interni in altre ore».

A questo proposito M. HUBER (Cfr. stesso *Bulletin cit.*, pag. 103) proponeva per questo caso particolare che «la potenza delle centrali elettriche delle miniere deve essere attribuita alle miniere se l'impiego è riservato esclusivamente a queste ultime, alle centrali elettriche se una parte dell'energia è venduta. Si attribuisce, allora, alla miniera la potenza dei suoi motori elettrici». Si tratterebbe insomma nell'ultimo caso considerato di scindere l'esercizio in due parti: uno per la miniera ed uno per la centrale elettrica. Quando però si tratta di quantità press'a poco equivalente destinata ai due usi la soluzione proposta non sembra accoglibile, a prescindere dall'inopportunità, di classificare le industrie elettriche fra le estrattive e viceversa.

In pratica però, fortunatamente, esistono spesso centrali o gruppi che funzionano esclusivamente o quasi per la trazione elettrica. Le ferrovie italiane dello Stato, ad es., nel 1938-39 ricevevano energia elettrica per linee elettrificate da 33 centrali con una potenza installata di 517.360 kW, di cui 7, con circa 141.000 kW installati, di proprietà delle stesse Ferrovie dello Stato. La parte di energia elettrica che queste centrali destinano ad usi diversi sono sempre modeste. Così ad es. le Ferrovie dello Stato nell'esercizio 1938-39 su circa 193 milioni di kWh di energia prodotta dalle centrali di proprietà delle FF. SS. utilizzati per la trazione elettrica, ne impiegarono circa 2 milioni per i cosiddetti servizi ausiliari delle centrali stesse (e quasi un milione di kWh fu venduto a terzi). Su un consumo totale di energia di oltre un miliardo di kWh (delle centrali delle FF. SS. e di centrali private) ne furono destinati circa 10 milioni per illuminazione parziale, manovre di apparati, centrali, riscaldamento, ecc. e 19 milioni furono venduti a terzi per usi industriali (in complesso meno del 2,9 %).

Teoricamente si può ottenere il dato che ci interessa considerando, anzichè la potenza primaria, la potenza dei motori elettrici di tutte le motrici elettriche in servizio dato di più facile e sicura determinazione.

A parte il fatto che non sempre si dispone di tali dati — per quanto sarebbe necessario di eseguire sempre i censimenti delle imprese di trasporto quando si eseguiscono censimenti industriali — accade che in realtà vi è fra i due dati una notevole differenza di cui si deve tener conto. Per le ferrovie elettriche si può arrivare ad un rapporto fra la potenza dei primi e dei secondi come da 1 a 4 e anche più (1).

* * *

Possibilità di equivoci sorgono quando — dopo avere eseguito il calcolo della potenza installata nel solo ramo di attività « imprese di trasporto » compresa la potenza dei mezzi di trasporto elettrici e non elettrici (scopo terzo) — si voglia scindere — come è spesso il caso — la cifra ottenuta in due parti : *a*) potenza complessiva di tutti i mezzi di trasporto (elettrici e non: $R + L$) ; *b*) potenza installata nell'impresa per scopi diversi dal trasporto : T, (cfr. paragr. 12 : secondo scopo). La potenza di cui al punto *a*) si ottiene aggiungendo alla potenza *primaria* di tutti i motori « mobili » dei veicoli autonomi *non elettrici* la potenza secondaria dei motori elettrici «mobili» dei veicoli elettrici. Per calcolare la potenza di cui al punto *b*) si applica uno dei tre criteri (A), (B), (C) di cui al secondo scopo, come se si trattasse di un qualsiasi stabilimento, *non* tenendo però conto (per evitare duplicazioni) della potenza dei motori elettrici dei mezzi di trasporto elettrici, poichè questa potenza figura già nella parte calcolata di cui al punto *a*).

Va tenuto infine presente che i confronti, fra impresa e impresa (o fra sottoclasse e sottoclasse) di « trasporto » — per giudicarne la diversa importanza dal punto di vista della « potenza » utilizzabile — limitati alla potenza di cui al punto *b*) potrebbero ingenerare errori se non si precisa il significato e lo scopo del calcolo. Infatti, ad es., un'impresa di trasporti elettrici che azionasse i motori elettrici dei veicoli con motori (e generatori) « fissi » di 100.000 CV, installati negli stessi locali dell'impresa, figurerebbe nella statistica con 100.000 CV. Un'altra impresa che facesse azionare l'identico numero di motori elettrici « mobili » dell' identica potenza ma con energia di acquisto (o anche con energia di una centrale di proprietà posta fuori dei locali della impresa e censita tra le industrie elettriche) figurerebbe con una potenza zero o minima (per la sola parte destinata ad eventuali officine meccaniche, ad illuminazione, frigoriferi, ecc.).

* * *

In pratica possono presentarsi *casi particolari* che possono risolversi anche in modo contrastante con i principî suddetti, per l'impossibilità di operare altrimenti, in mancanza di elementi disponibili o per possibili diverse interpretazioni dei criteri adottati (2) o anche perchè trattandosi di

(1) Al 30 giugno 1939 le Ferrovie dello Stato italiane (cfr. MINISTERO DELLE FERROVIE DELLO STATO, *Relazione per l'anno finanziario* 1938-39) indicavano per 5.208 motori di trazione per locomotive elettriche una potenza di 2,5 milioni di kW, mentre la potenza installata presso le centrali elettriche al servizio della trazione elettrica si può calcolare in circa 500.000 kW.

(2) Si considerino ad es. i seguenti casi :

a) nell'*industria della pesca* la potenza dei navigli, pescherecci, può essere assimilata alla potenza dei mezzi di trasporto — e quindi essere esclusa dal calcolo qualora questo non si estenda ai detti mezzi — oppure alla potenza dei motori primari « fissi » di un'industria (destinata ad azionare il macchinario)

Nei censimenti del 1937 si è preferita quest'ultima soluzione ritenendo che il peschereccio costituisca un mezzo essenziale per l'esercizio stesso dell'industria peschereccia (traino reti, lavorazione a bordo del pesce, ecc.) e sia, quindi *assimilabile* al macchinario di un'industria, ad una installazione fissa. Non è detto che questo criterio non sia discutibile ; importa in ogni caso renderlo noto nella pubblicazione delle statistiche. Nel censimento del 1927, sembra che si sia data la preferenza all'altro criterio — sebbene nulla sia detto al riguardo — poichè la potenza dei motori primari è di solo 991 CV (contro 102.239 nel 1937). Così in Francia nel 1926 : CV 419. In Italia nel 1927 si sono quindi, con ogni probabilità, censiti soltanto i motori « a terra » di esercizi pescherecci o forse anche i motori installati a bordo per frigoriferi, illuminazione, ecc. È peraltro evidente l'opportunità di fare tre distinzioni di motori ; motori per la propulsione del peschereccio, motori per installazioni fisse di bordo ; motori a terra.

quantità modeste, non torna conto di complicare conteggi atteso il carattere grossolanamente approssimativo dei risultati (cfr. paragr. 20). Queste considerazioni valgono, s'intende, sia per i trasporti che per qualsiasi altro ramo di attività economica. In tali casi occorre però rendere noti i diversi criteri seguiti per l'intelligenza delle cifre e per i confronti nel tempo e nello spazio.

* * *

Dalle osservazioni precedenti si possono trarre le seguenti conclusioni:

a) è opportuno che nelle statistiche delle macchine produttrici di energia e, in particolare, in quelle tratte dai censimenti industriali i « trasporti » figurino sempre a parte, separandoli sia dalle « comunicazioni » cui sono spesso uniti, sia dalle « industrie » vere e proprie (sia anche dai « servizi »).

b) è opportuno che i censimenti industriali siano sempre estesi anche alle « imprese di trasporto »;

c) è opportuno che nei questionari dei censimenti industriali si chiedano sempre notizie sui mezzi di trasporto impiegati dalle industrie e sulla loro potenza (specificando la natura di tale potenza: cfr. paragr. 3) ed indicando a parte la potenza dei mezzi di trasporto elettrici;

d) è opportuno che per le imprese di trasporto si calcoli sempre — a parte — la potenza dei motori primari ed elettrici applicati ai veicoli, con l'avvertenza di evitare duplicazioni di calcolo nel determinare la potenza complessiva dell'impresa (cioè dei motori « fissi » e dei « motori mobili »).

§ 25 - Tentativi di calcolare congetturalmente la potenza utilizzabile in Italia intorno al 1938 - Confronti con altri Stati. — Per eseguire il calcolo della potenza utilizzabile in Italia, per ciascuno dei cinque scopi esaminati, mancano molti dati statistici. Si è ritenuto tuttavia opportuno di compiere qualche tentativo in tal senso, allo scopo:

a) soprattutto, di approfondire, attraverso la concreta applicazione pratica, il significato e la portata delle formule indicate nel presente studio e rendersi così anche conto del largo grado di approssimazione dei calcoli;

b) avere un'idea più precisa delle numerose lacune ancora esistenti nella nostra statistica;

c) costruire un quadro largamente orientativo, anche se basato in parte su congetture, analogo a quello simbolico del prospetto 1, per avere un'idea meno imprecisa dell'attuale sui rapporti esistenti fra i probabili valori delle potenze utilizzabili relativi a ciascuno degli scopi considerati e per grandi branche di attività (economiche e non).

Due circostanze hanno altresì piegato la riluttanza iniziale a compiere i calcoli in questione. Da una parte la relativa abbondanza, in confronto al passato, di materiale statistico — pur essendo esso tuttora notevolmente lacunoso — per gli anni intorno al 1938, e, dall'altra, il notevole largo margine di scostamento dalla realtà dei risultati anche se ricavabili da dati statistici più completi e più attendibili.

Per detti anni si dispone infatti di un buon materiale statistico — sia pure, in parte, ancora provvisorio — offerto: dai primi spogli dei censimenti del 1937-39, sui motori, generatori, e sui mezzi di trasporto impiegati nell'industria, nelle imprese di trasporto e comunicazioni, nel commercio; di statistiche abbastanza approfondite e precise sul consumo di energia elettrica nel 1938 per branche di attività economiche (elaborate dall'UNFIEL); e, altresì di statistiche, esse pure ancora incomplete e approssimative, sulla potenza dei mezzi di trasporto motorizzati (elaborate dal RACI, dal Ministero delle Finanze, dalla Marina Mercantile) riferentisi alla fine del 1937 o del 1938.

---

segue nota 2.

b) I motori *eventualmente installati a bordo di navi da trasporto* per servizi vari (illuminazione, ventilazione, riscaldamento, frigoriferi, ecc. carico o scarico meccanico) debbono seguire la stessa sorte dei motori propulsori della nave od essere assimilati ai motori a terra?

Si è preferito, nel censimento del 1939, dato che si trattava di quantità relativamente modeste (CV 153.743 su 4,5 milioni circa escluse le FF. SS.) assimilarli all'apparato motore della nave che, talvolta, può fornire energia occorrente anche per i servizi diversi dalla propulsione. Tuttavia la soluzione è, opinabile ad es. per i navigli specialmente adibiti al carico e scarico di merci, sollevamenti, ecc. In ogni caso è necessario che nei questionari di censimento sia fatta la distinzione fra apparato motore e impianti fissi della nave e che nella pubblicazione dei dati si dia notizia del criterio seguito.

c) Per le *imprese marittime* che si occupano esclusivamente del *rimorchio* o *pilòtaggio* di navi nel porto, si può seguire la stessa soluzione indicata per la pesca o l'opposta. Nel censimento del 1937 è seguita la soluzione opposta.

d) I *trasporti limitati all'interno degli stabilimenti industriali* debbono seguire la stessa sorte dei comuni mezzi di trasporto dell'impresa? In Italia si è seguito lo stesso criterio salvo che per trasporti interni elettrici (di scarsa importanza) escluse però le funivie. In realtà i trasporti elettrici (carrelli elettrici e simili) — azionati talvolta dagli stessi motori primari che azionano, nello stesso stabilimento motori elettrici per macchine o attrezzi — dovrebbero anche essi essere esclusi dal calcolo quando si abbia in vista di determinare la sola potenza destinata ad azionare il macchinario o, invece, compresi se si calcola la potenza complessiva, compresi i trasporti, come abbiamo visto.

e) Vi è il caso delle *trattrici agricole* (la cui potenza è di notevole rilievo relativamente all'agricoltura) e le *macchine per lavori stradali*, i cui motori servono anche per il trasferimento della macchina stessa da un luogo all'altro, ma che sono da considerarsi, almeno prevalentemente, alla stregua dei motori fissi.

f) Vi sono mezzi di trasporto che hanno installato sul mezzo stesso, altri motori primari o elettrici destinati ad azionare gru o macchine la cui potenza dovrebbe essere considerata come impianto « fisso ».

Ciò non diminuisce affatto il carattere di larghissima approssimazione o, meglio ancora, di generico orientamento delle cifre ottenute, basate spesso su congetture e talvolta, sia pure per elementi di minore importanza, addirittura sulla fantasia del calcolatore.

La congettura basilare che ha permesso di superare i maggiori ostacoli — altrimenti insuperabili, allo stato attuale delle rilevazioni statistiche — prende le mosse dalle statistiche dell'UNFIEL sul consumo, in kWh, di energia elettrica prodotta nel 1938 da tutte le aziende produttrici (comprese quelle cosiddette « autoproduttrici », che destinano cioè alla propria impresa industriale l'energia prodotta).

Queste statistiche consentono di ripartire con sufficiente approssimazione il consumo suddetto sia per le tre grandi categorie d'impiego (azionare i macchinari, usi diretti, trazione elettrica), sia per grandi branche di attività (comprese le abitazioni private e le aziende domestiche).

Ne diamo quì di seguito la ripartizione approssimativa ricavata dai dati relativi all'anno 1938 (e in gran parte sinteticamente pubblicati nell'*Annuario Statistico Italiano del* 1939, pag. 107).

Prosp. 4 - PERCENTUALI APPROSSIMATIVE DEI CONSUMI IN kWH (1) DI ENERGIA ELETTRICA NEL 1938.

ATTIVITÀ	Azionamento macchinario	Energia impiegata per: Usi diretti (2)	Energia impiegata per: Trazione elettrica	TOTALE
1) Agricoltura	1,1	*0,4*	—	1,5
2) Industrie e servizi . . .	42,6	34,3	*0,5*	77,4
3) Trasporti e comunicazioni	*1,5*	*0,3*	10,5	12,3
4) Commercio, servizi pubblici, abitazioni, privati, ecc.	2,8	6,0	—	8,8
TOTALE . . .	**48,0**	**41,0**	**11,0**	**100,0**

(1) Misurati sul luogo di *consumo*. Le cifre in *corsivo* sono arbitrarie.
(2) Illuminazione (privata e pubblica), riscaldamento, usi elettrosiderurgici ed elettrochimici.

Si è supposto che la potenza in kW dei motori installati presso le imprese venditrici di energia elettrica si dividesse, anche essa, tra i diversi suddetti impieghi secondo le stesse percentuali. Ipotesi criticabile da diversi punti di vista, ma che può essere presa in considerazione per calcoli congetturali.

La potenza primaria installata presso le imprese di produzione, distribuzione e vendita di energia è stata censita dall'Istituto Centrale di Statistica il 31 dicembre 1938 in 7.449.000 kW, che si arrotondano in 7,5 milioni di kW. (1). Applicando a questa cifra le percentuali di cui al prospetto precedente si ottengono i seguenti dati, che saranno di particolare utilità per i nostri calcoli.

Prosp. 5 - POTENZA PRIMARIA INSTALLATA CORRISPONDENTE ALL'ENERGIA ELETTRICA ACQUISTATA (*e*) NEL 1938 (*in migliaia di CV di potenza primaria*).

ATTIVITÀ	Azionamento macchinario		Usi diretti		Trazione elettrica		Totale	
	CV	%	CV	%	CV	%	CV	%
1	2	3	4	5	6	7	8	9
1) Agricoltura . .	82,5	*2,3*	30,0	*1,0*	—	—	112,5	*1,5*
2) Industria e servizi	3.195,0	*88,8*	2.572,5	*83,7*	37,5	*4,5*	5.805,0	*77,4*
3) Trasporti e comunicazioni. .	112,5	*3,1*	22,5	*0,7*	787,5	*95,5*	922,5	*12,3*
4) Altre	210,0	*5,8*	450,0	*14,6*	—	—	660,0	*8,8*
Totale . . .	**3 600,0**	***100,0***	**3 075,0**	***100,0***	**825,0**	***100,0***	**7.500,0**	***100,0***

Supponendo esclusi gli autroproduttori (che probabilmente pesano per un massimo di 100-150.000 kW) è chiaro che al totale di cui alla colonna 2 corrisponde il valore della potenza dei motori elettrici installati nei luoghi di consumo azionati dall'esterno (con energia di acquisto) cioè il valore di *Ee espresso però in termini di potenza primaria* (escluse cioè, da una parte, le perdite di trasporto e di trasformazione e, dall'altra, l'eventuale potenza di motori elettrici installati in esubero al fabbisogno).

Si tratta quindi di una potenza espressa in termini di potenza primaria « praticamente » utilizzabile, anzichè di potenza « teoricamente » utilizzabile, quale risulta invece dalle formule determinate nel corso del presente studio. Questa circostanza ha un particolare rilievo in relazione a quanto si è detto ai paragrafi 4, 20 e 22 e servirà a dare ragione delle differenze tra i valori di Σ P e F sulle quali già si richiamò l'attenzione a pag. 50* e 51*.

I valori delle colonne 4 e 6 corrispondono, rispettivamente, ai valori di *Ue* e di *Re*, espressi in termini di potenza primaria rilevata sul luogo di produzione

Data la pratica, sempre più diffusa, di installare motori elettrici con una potenza complessiva

(1) Da questa cifra sono escluse le imprese che producono energia elettrica utilizzandola, esclusivamente o in grande prevalenza, per il proprio fabbisogno industriale: dette imprese sono invece comprese nella statistica dei consumi. Si suppone, tuttavia, che le percentuali di cui al prosp. 4 non si spostino sensibilmente anche eliminando le imprese autoproduttrici.

superiore a quella praticamente utilizzabile (specialmente per la trazione elettrica: cfr. par. 24), le differenze fra il valore di *Ee* e *Re* come sopra determinati — in termini cioè di potenza primaria, all'origine — e quelli ricavati dalle statistiche dei censimenti, rilevate sul luogo di consumo, debbono essere sensibili, specialmente per *Re*. Il valore di *Ue* come sopra determinato può considerarsi invece più vicino al valore della potenza delle installazioni dirette consumatrici (a parte le perdite di trasporto e trasformazione).

* * *

Ciò premesso si può procedere ai calcoli cominciando dal dato relativo alla potenza globalmente utilizzabile nel Regno, calcolato come dato a sè stante.

A) POTENZA UTILIZZABILE NEL REGNO, IN TERMINI DI POTENZA PRIMARIA, CALCOLATA COME CIFRA GLOBALE A SE STANTE.

1) *Calcolo per lo scopo quarto.* — Il calcolo più semplice è quello che concerne lo *scopo quarto*, cioè la potenza teoricamente utilizzabile, globalmente nel Regno, per qualsiasi uso, esclusi i trasporti non elettrici (ma compresi i trasporti elettrici) che è dato dal valore ΣP, cioè dalla potenza di tutti i motori primari installati nel Regno, più la potenza corrispondente alla energia elettrica importata. Il valore di ΣP determinato sul luogo di produzione è *teoricamente* uguale a $\Sigma Pm + \Sigma E + \Sigma U + \Sigma R$ (Cfr. ultima parte prospetto 3 a pag. 40*), valore determinato sul *luogo di consumo* cioè presso i singoli esercizi censiti.

Dai censimenti eseguiti del 1937-39 conosciamo però solo i valori della potenza dei motori primari fissi installati nell'industria (compresa l'industria elettrica) e nelle imprese di trasporto. Essi sono rispettivamente: CV 9.132.809 e CV 246.921. Non si conoscono quindi i dati relativi ai motori primari fissi installati: nell'agricoltura, nel commercio, nelle altre attività e presso i privati.

Per l'*agricoltura* si conoscono solo i dati relativi alla potenza dei motori primari disponibili nelle imprese che si dedicano all'« esercizio di macchine agrarie per conto terzi », di macchine agrarie e di motori, cioè, messi a disposizione degli agricoltori che non ne sono provvisti o lo sono soltanto parzialmente. I *motori* così censiti (1) si possono considerare alla stregua dei motori fissi dell'industria destinati ad azionare il macchinario. La *potenza* di questi motori primari è di circa 450.000 CV. (2) Da queste cifre sono però escluse le macchine agrarie semplicemente noleggiate (senza il conduttore) e le macchine a motore di proprietà dell'agricoltore che lavorano (soltanto o prevalentemente) per conto del proprietario. La potenza di queste macchine si può calcolare, in via induttiva, solo per le trebbiatrici e le sgranatrici (3) in circa 200.000 CV. Calcolando che la potenza delle altre macchine a motore di proprietà dell'agricoltore non sia di molto superiore, e tenuto conto dei noleggi, si può calcolare la potenza dei motori primari a disposizione dell'agricoltura in circa 1.000.000 CV (4).

Per il *commercio* si dispone soltanto dei dati relativi al censimento del 1927, dal quale risultarono installati 20.163 CV di motori primari: possiamo pensare che al 1938 si sia giunti al massimo a 30.000 CV (5).

Per le *altre attività* l'impiego di motori primari fissi non può essere che modestissimo e si fissa in una cifra massima di 20.000 CV (5).

L'*energia importata* nel 1938 costituisce l'1,6% del consumo totale. Supponendo che la potenza ad essa corrispondente costituisca l'1,6% dei 7,5 milioni di CV si otterrà un valore di 120.000 CV.

Ecco quindi i risultati approssimativi, in cifre tonde, del valore della potenza primaria (ΣP), intorno al 1938:

	CV
Agricoltura (comprese le trattrici)	1.000.000
Industrie e servizi (compresa l'industria elettrica)	9.133.000
Trasporti e comunicazioni (esclusi i mezzi di trasporto)	247.000
Commercio	30.000
Altre attività	20.000
TOTALE (Σ P) nel Regno	10.430.000
Potenza primaria corrispondente alla energia elettrica importata	120.000
COMPLESSO	10.550.000

che si arrotondano a **11.000.000**.

2) *Calcolo per lo scopo quinto, secondo, primo, terzo.* — La potenza utilizzabile per lo *scopo quinto* corrisponde a quella dello scopo quarto meno il valore di ΣU ($O = \Sigma P - \Sigma U$: Cfr. prospetto 3) espresso in termini di potenza primaria. Il valore di *Ue* indicato nel prospetto 5 è di CV 3.075.000

(1) Comprese le *trattrici agricole*.

(2) Cfr. « *Avvertenze alle tavole* » - § 11 - pag. 30 del del presente volume.

(3) Cfr. ISTITUTO CENTRALE DI STATISTICA, *Il censimento delle trebbiatrici e sgranatrici* al 1° agosto 1937-XV. Monografia n. 4, redatta dal Prof. PAOLO ALBERTARIO.

(4) Contro CV 1.700.000 circa di motori primari installati nelle industrie, escluse le industrie elettriche. Le industrie, peraltro, impiegano in gran parte energia elettrica così poco diffusa in agricoltura.

(5) In Francia nel 1931 risultavano installati motori primari nel commercio per circa 31.000 CV e nelle attività professionali, uffici pubblici, amministrativi ecc. per circa 21.000 CV.

Manca il valore di *Ui*, cioè della potenza corrispondente alla elettrica prodotta all'interno degli stabilimenti e destinata, all'interno degli stabilimenti stessi, ad usi diretti (elettrosiderurgici, elettrochimici, illuminazione, riscaldamento). Non si dispone di dati al riguardo, ma è da presumere che si tratti di quantità minime, rarissimo essendo il caso di industrie elettrochimiche ed elettrometallurgiche — le massime consumatrici — autoproduttrici, dato che le imprese produttrici di energia elettrica offrono, per questi scopi, energia elettrica a prezzi modestissimi (si calcola nel 1938 un prezzo medio di L. 0,07 per kWh contro un prezzo medio per forza motrice di circa L. 0,30). Poco frequenti sono i casi di autoproduzione di energia per illuminazione, e ancor meno per riscaldamento.

Si ritiene pertanto di assegnare a *Ui* un valore massimo di circa 125.000 CV (4,1% di *Ue*) installati. Sarà quindi $\Sigma U = 3.200.000$.

La potenza utilizzabile per il quinto scopo si può quindi calcolare in termini di potenza primaria, in: 11.000.000 (ΣP) — 3.200.000 (ΣU) = 7.800.000

Per lo *scopo secondo* occorre dedurre, dal valore di cui allo scopo quarto, il valore di ΣR. Dal prospetto 5 conosciamo il valore ΣRe, espresso in termini di potenza primaria, pari a CV 825.000.

Questo valore corrisponde per la quasi totalità del valore di ΣR essendo eccezionali i casi di trazione elettrica all'interno dello stabilimento (*Ri*) La cifra precedente si può pertanto arrotondare a 850.000 CV. Avremo quindi: T = 11.000.000 (ΣP) — 850.000 (ΣR) = 10.150.000.

Per lo scopo *primo* basta dedurre dal valore di ΣP (11.000.000) la somma dei due valori già calcolati per ΣU e ΣR, cioè CV 4.050.000, avremo quindi M = 11.000.000 (ΣP) — 4.050.000 ($\Sigma U + \Sigma R$) = 6.950.000

Il calcolo della potenza per lo *scopo terzo* si ottiene aggiungendo alla potenza di cui allo scopo quarto quella di tutti i mezzi di trasporto effettuati con motori primari *non elettrici* mobili, pari a CV 24.000.000 (secondo il calcolo che faremo successivamente al punto *C*).

Riassumendo, avremo quindi i seguenti dati:

POTENZA UTILIZZABILE (IN CV) NEL COMPLESSO DEL REGNO ESPRESSA IN TERMINI DI POTENZA PRIMARIA

	CV
Primo scopo – Per azionare il macchinario ($\Sigma P + \Sigma U + \Sigma R$)	6.950.000
Secondo scopo – Per qualsiasi uso, esclusi i trasporti (elettrici e non) ($\Sigma P - \Sigma R$)	10.150.000
Terzo scopo – Per qualsiasi uso, compresi i trasporti (elettrici e non) ($\Sigma P + \Sigma L$)	35.000.000
Quarto scopo – Per qualsiasi uso, esclusi i trasporti non elettrici (ΣP)	11.000.000
Quinto scopo – Per azionare il macchinario e per i trasporti elettrici (esclusi i trasporti non elettrici) ($\Sigma P - \Sigma U$)	7.800.000

B) POTENZA UTILIZZABILE NEL REGNO, IN BASE ALLA SOMMA DELLE POTENZE CALCOLATE PER CIASCUN ESERCIZIO, SUL LUOGO DI CONSUMO.

Per lo *scopo primo*, cioè per azionare il macchinario vale la formula:

$$\Sigma Pm + \Sigma E = (\Sigma P - \Sigma G) + \Sigma E. = M.$$

Dai censimenti eseguiti nel 1937-39 si conosce il valore di M per le *industrie ed i trasporti* pari rispettivamente a CV 6.275.000 (P = CV 9.133.000; G = 8.283.000; Pm = 850.000; E = 5.425.000) e CV 333.000 (P = 247.000; G = 99.000; Pm = 148.000; E = 185.000).

Per l'*agricoltura*, supponendo che non esistano generatori elettrici, il valore della potenza dei motori primari calcolata in precedenza in CV 1.000.000 è uguale a ΣPm. La potenza dei motori elettrici azionati dall'esterno — espresso nei termini di potenza primaria *al luogo di produzione* — risulta dal prospetto 5 in 82.500 CV (1) e poichè si è supposto che non esistano generatori elettrici, si può considerare questo valore come eguale a ΣE. Questo valore deve essere però ridotto di circa il 20% per essere riferito *al luogo di consumo* dovendo tenere conto, da una parte delle perdite di trasporto e trasformazione (circa 30%: cfr. § 20) e dall'altra di un esubero — minimo in agricoltura — di installazioni motori elettrici. Si può pertanto assegnare un valore di 70.000 CV. La potenza utilizzabile sarà quindi di 1.070.000.

Per il *commercio*, supposto anche per questo la mancanza di generatori elettrici, la potenza di Pm (= ΣP) risulta dal calcolo precedente in 30.000 CV. Per la potenza dei motori elettrici non si dispone di dati all'infuori di quelli del 1927 che davano una potenza di 94.248 CV, che si può supporre sia aumentata, nell'intervallo più che decennale, del 50% tenuto conto della crescente diffusione dei motori elettrici anche negli esercizi pubblici e commerciali. Avremo quindi una potenza di CV 150.000, che aggiunta alla potenza dei motori primari forma il totale di 180.000 CV.

Per le *private abitazioni, uffici pubblici, ecc.* — compresa la potenza degli ascensori — l'impiego di motori elettrici (si esclude l'impiego dei motori primari) non può essere che modesto e si può assegnare a tale titolo una potenza press'a poco eguale a quella calcolata per i motori elettrici del commercio, cioè 150.000 CV che si riduce, per comodità di arrotondamento, a 142.000. (2).

(1) Per le sole trebbiatrici e sgranatrici si usarono nel 1937 motori elettrici per la potenza di 45.818 CV.

(2) Dalle statistiche dei consumi di energia elettrica per le abitazioni private e commercio si può ricavare un consumo per forza motrice pari a circa il 3 % del totale. Tale percentuale

In conclusione la potenza utilizzabile per azionare il macchinario, (scopo *primo*), sarà :

ATTIVITÀ	TOTALE	DI CUI	
		Pm	*E*
Agricoltura	1.070.000	1.000.000	70.000
Industria e servizi (compresa ind. elettrica)	6.275.000	850.000	5.425.000
Trasporti (esclusi i motori «mobili») .	333.000	148.000	185.000
Commercio	180.000	30.000	150.000
Altre attività . . .	142.000	—	142.000
TOTALE ($\Sigma Pm + \Sigma E$)	**8.000.000**	**2.028.000**	**5.872.000**

Questa cifra dovrebbe corrispondere, teoricamente, a quella calcolata in base alla potenza primaria, che invece abbiamo visto ammontare a 6.950.000. Il dato determinato sul luogo di consumo è quindi superiore di 1.050.000 CV pari al 15%. È, cioè: $\Sigma Pm + \Sigma E > \Sigma P - \Sigma (U + R)$.

Questa differenza trova la sua spiegazione nel fatto, più volte rilevato, della sempre più frequente installazione nell'industria di motori elettrici di potenza sensibilmente superiore a quella praticamente utilizzabile.

Per lo *scopo secondo* si deve aggiungere al valore precedente quello di ΣU calcolato sul luogo di consumo. Per questo dato non si dispone di alcuna rilevazione diretta. Si può tuttavia calcolarlo congetturalmente partendo dal valore ΣUe, prima determinato, in termini di potenza primaria. Considerando una perdita del 30% per trasporto e trasformazione di energia si avrebbe un valore di 2.152.500 al quale va aggiunto il valore di ΣUi già fissato in 125.000 CV. In cifra tonda si può assegnare un valore di 2.300.000. Avremo quindi un valore di 10.300.000 CV.

Per lo *scopo quarto* si deve aggiungere al precedente valore quello di ΣR cioè dei motori elettrici «mobili» dei mezzi di trasporto rilevato *sul luogo di consumo*. Secondo i censimenti eseguiti nel 1937-39 detta potenza ammonta a ben 3.742.452 CV nelle sole imprese di trasporto e comunicazioni (comprese le FF.SS.). Considerato che tale potenza costituisce il 95,5% del complesso (cfr. prosp. 5), questo corrisponderà in cifra tonda a 3.920.000 CV. Sarebbero dunque applicati ai mezzi di trasporto (elettrici) motori elettrici con una potenza superiore di 4,6 volte alla potenza *primaria* dei motori «fissi» impiegata per la trazione elettrica (calcolata in 850.000 CV). Dato attendibile poichè, come si è visto (cfr. nota (1) a pag. 59*) per le Ferrovie dello Stato, che esercitano prevalentemente la trazione elettrica, il rapporto rilevato fu da 1 a 5.

Per lo scopo quarto avremo quindi un valore di 14.220.000 CV.

Per lo *scopo terzo* si aggiungerà al valore di cui al precedente scopo il valore di ΣL che determineremo in 24.000.000 CV. Avremo cioè CV 38.220.000.

Per lo *scopo quinto* si toglierà dal valore di cui allo scopo quarto (14.220.000) il valore di ΣU (2.300.000). Si otterrà quindi un valore di 11.920.000 CV.

Si riassumono i risultati nel seguente prospetto (col. 3) mettendoli a confronto con quelli precedentemente rilevati in termini di potenza primaria.

Prosp. 6 - POTENZA TEORICAMENTE UTILIZZABILE NEL REGNO, INTORNO AL 1938 (IN CV).

SCOPI DEL CALCOLO	POTENZA GLOBALE		DIFFERENZE (col. 3 - col. 2)	
	A) in termini di potenza primaria sul *luogo di produzione*	*B*) in termini di potenza rilevata sul *luogo di consumo*	CV	%
1	2	3	4	5
Primo scopo - Per azionare il macchinario	6.950.000	8.000.000	1.050.000	*15,1*
Secondo scopo - Per ogni uso, esclusi tutti i trasporti	10.150.000	10.300.000	150.000	*1,5*
Terzo scopo - Per ogni uso, compresi tutti i trasporti	35.000.000	38.220.000	3.220.000	*9,2*
Quarto scopo - Per ogni uso, esclusi i soli trasporti non elettrici . .	11.000.000	14.220.000	3.220.000	*29,3*
Quinto scopo - Per azionare il macchinario e per i soli trasporti elettrici	7.800.000	11.920.000	4.120.000	*52,8*

C) POTENZA DEI MEZZI DI TRASPORTO NON ELETTRICI.

Per il calcolo di questa potenza si dispone delle seguenti fonti:

a) Dati sugli automezzi, classificati per classi di potenza, iscritti nel pubblico registro automobilistico (statistiche del RACI);

b) Dati sulla potenza degli automezzi in circolazione (statistiche del Ministero delle Finanze);

c) Statistica dei trasporti marittimi della Marina Mercantile;

d) Risultati provvisori del censimento 1937-39 circa i mezzi di trasporto delle industrie, dei servizi, delle imprese di trasporto e comunicazione, del commercio (i dati si riferiscono per oltre il 70% al 1938).

Le due fonti *a*) e *b*) sono state utilizzate congiuntamente per determinare la potenza degli autoveicoli esistenti ottenendo una cifra, espressa in termini

segue nota 2.

applicata alla potenza totale di 7.500.000 darebbe un valore di *Ee* pari a 225.000. Tenendo conto dei motori primari del commercio (30.000 CV) e dell'abbondante installazione dei motori elettrici la cifra di 322.000 CV, calcolata per le due ultime categorie insieme considerate, può ritenersi abbastanza congrua.

di potenza *effettiva* — che è di 1,5 - 2,5 volte superiore a quella *fiscale* risultante dalla statistica : cfr. par. 3 pag. 13*) — di 17.000.000 di CV (1).

Da questa cifra è però esclusa la potenza : *a*) dei mezzi di trasporto non elettrici delle ferrovie dello Stato (locomotive a vapore e a combustione interna) ammontanti, secondo i dati provvisori del censimento, a 3.970.870 CV effettivi ; *b*) dei trasporti per via mare, lacuali e fluviali, ammontanti secondo il censimento 1938 a CV effettivi 2.400.000 (2) ; *c*) dei trasporti a vapore extraurbani e urbani (esclusi i non elettrici) ammontanti a 213.127 CV effettivi ; *d*) i trasporti aerei civili 224.310 CV effettivi ; *e*) autoscafi e motoscafi da diporto e privati calcolati in 50.000 CV effettivi.

In complesso, per queste voci si avrebbe una potenza primaria in CV effettivi di 6.858.000 arrotondabili a 7.000.000 che, aggiunti alla potenza degli autoveicoli sopra calcolata in 17.000.000, portano la potenza complessiva dei mezzi di trasporto non elettrici a CV 24.000.000 (esclusi i mezzi di trasporto militari e i mezzi bellici motorizzati)

Per decomporre questa cifra fra agricoltura, industria, trasporti, commercio e altre attività (compresi i privati) si possono utilizzare i risultati provvisori dei censimenti 1937-39 per industrie, trasporti e commercio. Per l'*agricoltura* non esiste alcun elemento ma, fortunatamente, non si può trattare che di modeste cifre, le quali, anche se calcolate in base ad ipotesi arbitrarie, non disturbano i nostri calcoli. Si è peraltro supposto che l'agricoltura possedesse circa 1/6 dei mezzi di trasporto dell'industria (1.100.000 CV di potenza effettiva), ritenendo che esista lo stesso rapporto già riscontrato nei dati della potenza utilizzabile per azionare il macchinario.

Per le *attività private* si può procedere per differenza, deducendo cioè l'ammontare della potenza calcolata per le altre attività dalla cifra ora determinata di CV 24.000.000.

I risultati ottenuti dopo aver ridotto, quando ne era il caso, la potenza da fiscale ad effettiva, sono i seguenti :

	CV effettivi (1)
Agricoltura	200.000
Industrie e servizi	1.100.000
Trasporti e comunicazioni (2)	9.100.000
Commercio	1.200.000
TOTALE	**11.600.000**
Ai privati e altre attività spetta la differenza di	12.400.000

(1) I dati della potenza dei mezzi di trasporto rilevati dal censimento si presumono espressi in potenza fiscale (salvo che per i locomotori).

(2) Sono compresi sia i veicoli delle imprese di trasporto che i mezzi di trasporto sussidiari delle imprese stesse. La potenza espressa in CV fiscali (per autobus, autocarri ecc.) venne ridotta in potenza effettiva. In realtà nel questionario di censimento venne chiesta la potenza effettiva, ma da indagini dirette compiute si è accertato che il censito ha indicato sempre la potenza fiscale, questa essendo la sola potenza a lui nota, risultante dal libretto di circolazione dell'automezzo.

La cifra per i «privati ed altre attività» è di poco superiore a quella della potenza, in CV effettivi, calcolata sulla base delle statistiche del R.A.C.I. per le sole autovetture (CV 11.938.000) in grande prevalenza appartenenti a privati, liberi professionisti, ecc.

* * *

Per redigere, sulla base delle cifre sopra determinate, un prospetto analogo al quadro simbolico indicato all'inizio del presente studio (cfr. prospetto 1

---

(1) È noto che i dati di cui alla fonte *a*) non sono comparabili con quelli di cui alla fonte *b*) per le seguenti principali ragioni : quest'ultima considera soltanto gli automezzi che hanno pagato la tassa di circolazione nell'anno e non tengono conto degli automezzi esonerati temporaneamente o definitivamente dalla tassa di circolazione ; il RACI (fonte *a*) dà invece cifre sensibilmente superiori perchè molti automezzi definitivamente scomparsi dalla circolazione continuano a rimanere iscritti, ma anch'esso non tiene conto di un certo numero di automezzi esonerati dall'iscrizione nel pubblico registro automobilistico. Dato lo scopo del calcolo di determinare cioè la potenza «teoricamente» utilizzabile, i dati più adatti da prendere in considerazione sarebbero quelli del R.A.C.I. opportunamente depurati, da una parte — per tenere conto, congetturalmente, del numero di autoveicoli iscritti in più e, aumentati dall'altra, — per tener conto degli autoveicoli non soggetti a iscrizione. Per la decurtazione ci si è basati sui calcoli compiuti al 31 dicembre 1934 dal LIVI il quale calcolò che fatto uguale a 100 il numero delle macchine iscritte al P.R.A. il numero delle macchine circolanti sarebbe di 85,55 per le autovetture e di 80,02 per gli autocarri (cfr.) L. LIVI, *Indagine sulla frequenza dei sinistri automobilistici in rapporto agli automezzi in circolazione ed al chilometraggio* in R.A.C.I. *Incidenti stradali in Italia* nel triennio 1934-36 Edizione R.A.C.I. Roma 1938, pag. 91 e seg.).

Entrambe le statistiche esaminate indicano la potenza fiscale e non la potenza effettiva (cfr. parag. 3 pag. 13*). Si è dovuto quindi operare la necessaria trasformazione per rendere omogenei i dati con quelli relativi ai motori fissi ed ai motori degli altri mezzi di trasporto (a vapore, elettrici, ecc.) — con i quali vanno sommati — la cui potenza è espressa, invece, in CV effettivi.

Per la determinazione della *potenza fiscale* complessiva degli autoveicoli iscritti nel P.R.A. si è utilizzata la statistica al 31 dicembre 1937 (pubblicata nel *Bollettino mensile di statistica*, maggio 1938) che classifica i diversi automezzi per classi di potenza abbastanza dettagliate. Si è attribuita agli autoveicoli indicati per ogni classe di potenza una potenza media (fiscale) corrispondente alle cifre estreme della classe (ad esempio, per le autovetture, una potenza di 11,5 CV per la classe da 11 a 12 CV) ; per le classi aperte inferiori si è attribuita una potenza un po' minore e, per le classi aperte superiori una potenza un po' maggiore.

I dati ottenuti — previa decurtazione — non differiscono sensibilmente, salvo che per gli autobus — che hanno d'altronde un'importanza modesta — da quelli ricavati dalle statistiche sugli autoveicoli in circolazione alla stessa data, tenuto conto che le unità considerate sono inferiori, come si è detto, dal 15 al 20 % circa a quelle del R.A.C.I.

Si è tenuto infine conto del fatto che i dati dei censimenti industriali si riferiscono per lo più al 1938 e che dal 1937 al 1938 vi è stato un incremento nel numero degli autoveicoli in circolazione. Si sono quindi apportati alle cifre sopra rettificate aumenti percentuali corrispondenti per le autovetture al 6,63%; per gli autobus e autocarri all'1,83 % ; per i motocicli all'1,20%

Esprimendo le cifre in potenza effettiva in base al coefficiente medio di 2,5 per le autovetture e motocicli e di 1,5 per autobus e autocarri (cfr. nota 3 a pag. 13*) si è ottenuto il valore di 17.000.000 CV effettivi.

(2) Cifre *provvisorie* in cavalli-asse al 31 ottobre 1938. Secondo le statistiche della Marina Mercantile al 31 dicembre 1938 si calcolava una potenza di circa CV-asse 2.700.000 dei natanti iscritti nei registri il cui numero è talvolta lievemente superiore alla realtà, per mancate depennazioni di natanti demoliti o sinistrati.

a pag. 22*) manca ora solo di distribuire i valori di ΣU e di ΣR nelle grandi branche di attività. Trattandosi in grande prevalenza di potenza corrispondente a energia elettrica acquistata dall'esterno ci varremo a questo fine delle percentuali delle colonne 5 e 7 del prosp. 5. I risultati ottenuti sono esposti nel seguente prospetto 7.

Da questo si rileva, fra l'altro, che

1) la potenza « teoricamente » utilizzabile misurata sul luogo di consumo (secondo le formule note) supera — malgrado le perdite per trasporto a distanza e trasformazione — l'analoga potenza misurata sul luogo di produzione, per tutti i cinque scopi considerati. Conseguenza, come è noto, delle esuberanti installazioni di motori elettrici (fissi e, specialmente, mobili) in conformità alla potenza primaria di essi » praticamente » utilizzabile.

Fatta uguale a 100 la potenza primaria consumata sul luogo di produzione, la potenza sul luogo di consumo diviene, per i singoli scopi:

1°	2°	3°	4°	5°
115,1	101,1	109,1	129,1	152,7

con una divergenza massima del 52,7 % per lo scopo quinto, per il quale pesa sensibilmente la cospicua differenza sopra rilevata, per i motori elettrici « mobili » della trazione elettrica.

Per il solo ramo « industrie e servizi » gli scostamenti sono invece minori (nulli per lo scopo 1°) come lo dimostrano i seguenti indici:

1°	2°	3°	4°	5°
115,1	100,1	102,2	102,5	117,5

che segnano i massimi dove (scopo 5° e 1°) prevalgono i motori elettrici (mobili o fissi).

Prosp. 7 - POTENZA TEORICAMENTE UTILIZZABILE IN ITALIA INTORNO AL 1938. IN MIGLIAIA DI CV DI POTENZA EFFETTIVA (1)

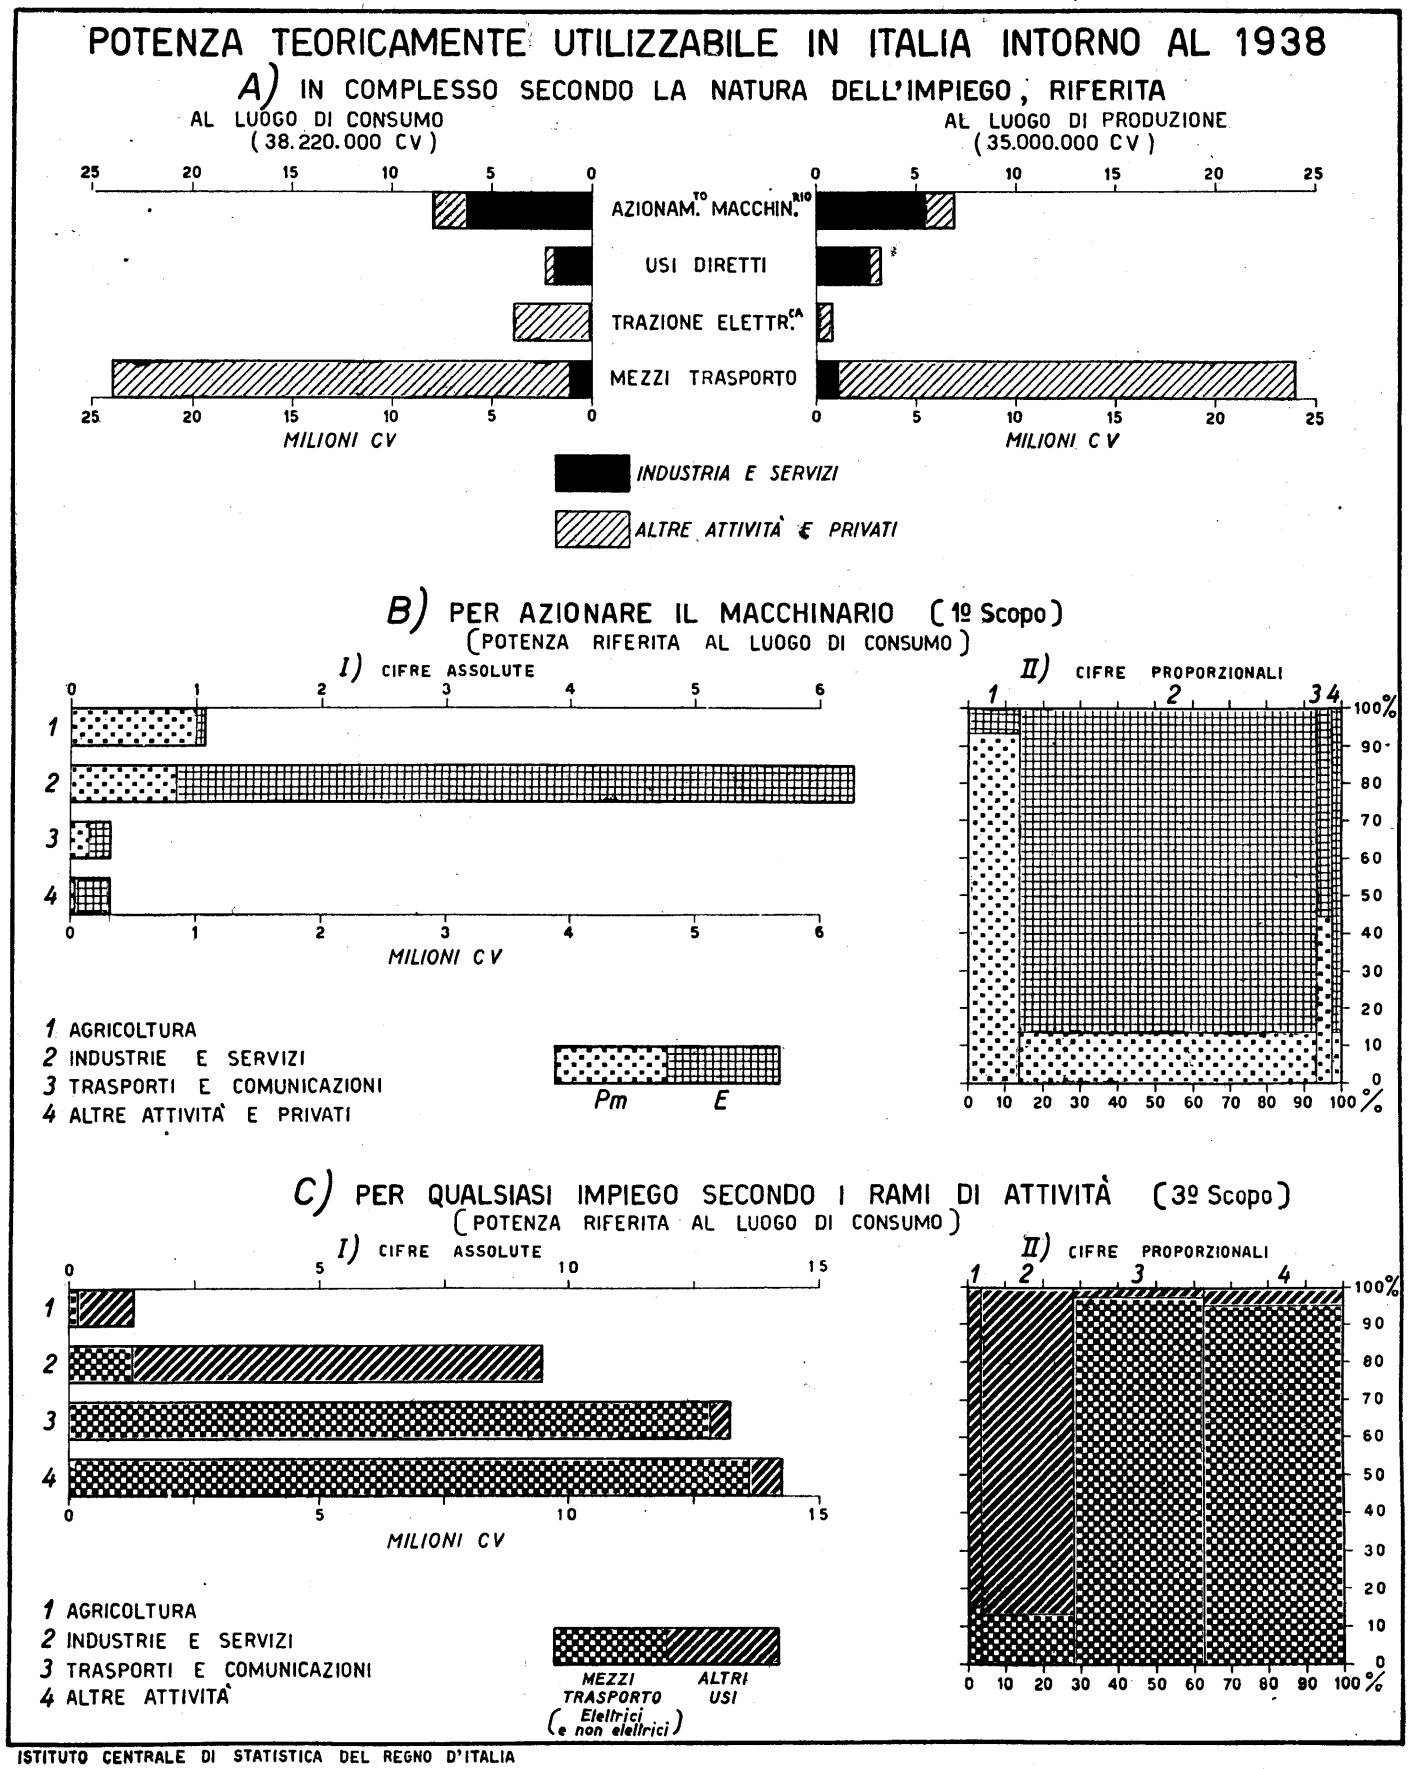
(1) Le cifre assolute in carattere normale indicano i valori della potenza teoricamente utilizzabile con riferimento al luogo di consumo; quelle sottostanti in carattere *piccolo* indicano i valori riferiti al luogo di produzione, in termini cioè di potenza primaria.

(2) Potenza dei motori *primari fissi* producenti energia per la trazione elettrica.



POTENZA TEORICAMENTE UTILIZZABILE IN ITALIA SECONDO LA NATURA DELL'IMPIEGO E PER RAMI DI ATTIVITÀ.

2) Per tutti gli scopi considerati, eccetto il terzo, spetta alla industria una proporzione superiore al 50 % e variabile del 54,1 % (scopo quinto) al 79,6 % (scopo secondo).

Per lo scopo terzo considerando anche la potenza di tutti i mezzi di trasporto, la percentuale scende al 24,8 % : la massima (37,3 %) spetta al commercio e altre attività non commerciali (compresi i privati).

Confronti con altri Stati — Questi confronti presentano notevoli difficoltà sia per la diversa estensione data ai censimenti (che escludono talvolta gli esercizi artigiani,o quelli con un numero limitato di addetti, o particolari classi di industria), sia per i diversi criteri di rilevazione.

Riteniamo tuttavia opportuno, per fissare l'ordine di grandezza di alcune cifre, di citare i seguenti dati:

Germania (censimento 1933). La potenza utilizzabile per azionare il macchinario dell'industria e dell'artigianato è stata valutata a 23,8 milioni di CV contro i nostri 6,3 per il 1937-39. La potenza di tutti i motori *primari* (scopo quarto) è stata censita in 27.949.000 CV, esclusa l'agricoltura e le attività private. L'analoga potenza per l'Italia (nel 1937-39) è di circa 10 milioni di CV.

Regno Unito (Censimento 1930). La potenza utilizzabile per azionare il macchinario (esclusi gli esercizi con meno di 10 addetti) dell'industria e servizi (esclusa l'industria elettrica) è stata valutata a 15,3 milioni contro i nostri 6,3. La potenza complessiva di tutti i motori primari (per lo scopo quarto) è stata valutata per la sola industria (e servizi), compresa l'industria elettrica, in 21,2 milioni di CV (sempre per gli esercizi con più di 10 addetti) contro 8,2 milioni di CV dell'Italia (nel 1937-39).

Francia (censimento 1931) : La potenza installata di tutti i motori primari (per lo scopo quarto) secondo la statistica ufficiale francese più volte citata, è stata valutata a 11,2 milioni di kW pari a circa 15,2 CV contro gli 11 milioni dell'Italia nel 1937-39.

Riserve si devono tuttavia sollevare per ciò che concerne la potenza primaria installata in agricoltura che la statistica francese indica in soli 160.000 kW (pari a circa 212.000 CV) contro 1 milione circa di CV da noi calcolati. La notevole differenza dipende, con ogni probabilità, dal fatto che la statistica francese non considera la potenza dei motori primari di macchine agricole «mobili» (trattrici, trebbiatrici, locomobili, ecc.). Eliminando sia dalla statistica francese sia dalla nostra la potenza dei motori primari dell'agricoltura, si avrebbe, per la Francia (1931) una potenza complessiva di 15 milioni di CV contro circa 10 milioni per l'Italia (nel 1937-1939).

§ **26. - Conclusioni principali.** — La statistica delle macchine generatrici di energia (in esse compresi motori primari ed elettrici dei mezzi di trasporto) e la determinazione della potenza utilizzabile — malgrado sia vecchia di oltre un secolo — costituisce uno dei capitoli più trascurati della statistica industriale. Il calcolo di detta potenza ha dato più volte luogo in Italia e all'estero a calcoli errati o imprecisi (cfr. par. 17). Per migliorare la statistica esistente si è ritenuto opportuno riesaminare a fondo la materia e le principali conclusioni dello studio compiuto — per ciò che concerne le necessità statistiche e, in particolare, quelle dei censimenti — si possono così riassumere :

A) Rilevazione dei dati

1) Per ottenere dati attendibili è necessario che la rilevazione dei dati relativi alla potenza delle singole macchine generatrici di energia sia accompagnata da precise istruzioni (cfr. *allegato*);

2) La rilevazione stessa potrà riuscire pienamente soddisfacente quando:

a) la potenza dei motori e generatori sia determinata dai costruttori con criteri precisi ed uniformi ;

b) esistano norme, seguite dalla generalità dei costruttori, per l'apposizione, sulle singole macchine, di targhe contenenti l'indicazione della potenza. Da questo punto di vista sarebbe molto opportuno che in Italia le norme finora redatte sotto gli auspici del Consiglio Nazionale delle Ricerche, venissero rese obbligatorie per legge e che esse venissero completate al fine di estendere l'obbligo di applicare le targhe (con l'indicazione della potenza) anche a tutti i tipi di motori primari (cfr. § 3).;

3) Il crescente impiego di energia elettrica, sul posto e a distanza per usi diversi dall'azionamento del macchinario, richiede che la rilevazione dei dati venga sempre estesa oltre che ai motori (primari ed elettrici) anche ai generatori elettrici.

4) Al fine di disporre dei dati necessari ad uno studio completo e approfondito della materia e ai confronti nazionali ed internazionali (nel tempo e nello spazio) sarebbe opportuno di rilevare tutte le notizie indicate nell'*allegato* questionario-tipo di rilevazione relativo alle macchine «fisse».

Per i mezzi di trasporto da censire occorrerà aver cura di distinguere sempre i trasporti elettrici dagli altri (cfr. nota 1 a pag. 58* e pag. 61*, punto *d*);

5) Per disporre di dati attendibili e completi sulla potenza utilizzabile sarebbe opportuno :

a) estendere sempre le rilevazioni alle macchine generatrici di energia, a tutti i mezzi di trasporto motorizzati (elettrici e non), a tutti i rami di attività (economica e non) compresa l'agricoltura, le case di abitazione e le aziende domestiche. Attesa la difficoltà di compiere rilevazioni così estese sarebbe opportuno che esse venissero eseguite almeno in occasione dei censimenti economici (agricoli, industriali e commerciali) ormai effettuati con una certa frequenza nella maggior parte degli Stati.

I dati relativi agli esercizi che producono, distribuiscono, vendono energia elettrica debbono essere sempre tenuti nettamente distinti da quelli degli esercizi di altre attività economiche anche se ad essi eventualmente abbinati. Per le attività artigiane, l'agricoltura ed il commercio la rilevazione può essere limitata al complesso dei motori elettrici ed ai motori primari (senza distinzione di tipo) e ai mezzi di trasporto.

Per le imprese di trasporto si dovranno seguire i criteri indicati nelle conclusioni del paragrafo 24 a pag. 61*.

b) assumere precise informazioni sui criteri da seguire per trasformare i dati della potenza fiscale di alcuni mezzi di trasporto in potenza effettiva. (cfr. par. 3, e par. 25, pag. 65* e seg.).

c) accompagnare i risultati da elaborate statistiche sulla produzione e sull'impiego di energia elettrica nell'anno di censimento, secondo la natura dell'impiego (forza motrice, e trazione elettrica, altri usi) e per rami di attività economica (cfr. nota 2 a pag. 8*). Tali dati possono essere rilevati in gran parte anche in occasione dei censimenti (cfr. il prosp. III dell'*allegato*).

B) - CALCOLO DELLA POTENZA « TEORICAMENTE » UTILIZZABILE.

6) Si è ritenuto opportuno e conveniente limitare il calcolo alla potenza « teoricamente utilizzabile » dopo averne precisato il significato e le divergenze nei confronti dei dati relativi alla cosidetta potenza « installata » ; alla potenza « praticamente utilizzabile » e alla potenza utilizzata (cfr. par. 4 pag. 13* e segg.).

7) Il dato relativo alla potenza teoricamente utilizzabile varia sensibilmente a seconda degli scopi del calcolo.

È perciò indispensabile che siano sempre precisati chiaramente gli scopi stessi usando per ciascuno di essi formule appropriate. I principali cinque scopi del calcolo sono indicati nei paragrafi 5 e, altresì, insieme alle formule da usarsi, ai par. 11, 12, 13, 14, 15, 16 (cfr. in particolare prospetto 3 a pag. 40*). Ove le notizie statistiche rilevate non consentano di disporre di tutti gli elementi necessari il calcolo della potenza utilizzabile per un determinato scopo, è necessario precisare le lacune e, se possibile, colmarle con calcoli congetturali.

8) Per comodità e semplicità di calcolo è frequente l'uso di calcolare la potenza globalmente installata in uno Stato (come cifra a sè stante) con un metodo diverso da quello impiegato per il calcolo della potenza utilizzabile nei singoli stabilimenti : occorre in questo caso assicurarsi che l'applicazione dei due diversi metodi conduca, per l'intero Stato, a risultati teoricamente uguali (cfr. § 3, C, pag. 23* ; § 8 ; § 11 ; § 12 ; § 13 ; § 14 ; § 15). Il calcolo della potenza globale installata nello Stato (come cifra a sè stante) deve applicarsi alla totalità delle attività (economiche o non) dello Stato, senza esclusione di alcun ramo di attività. Esso non può applicarsi alle singole circoscrizioni territoriali (cfr. § 16, pagg. 39* e 41*).

9) Le ultime raccomandazioni fatte dall'Istituto Internazionale di Statistica (nel 1936) sul calcolo della potenza sono in parte errate e in parte lacunose. Sarebbe pertanto opportuno promuovere un'azione per apportarvi le correzioni ed i completamenti necessari (cfr. par. 19).

Per il calcolo della potenza utilizzabile sarebbe opportuno adottare in tutti gli Stati un criterio uniforme. Si ritiene che il criterio più adatto sia quello chiamato nel testo criterio (C) o il suo equivalente criterio (B) (cfr. par. 18). L'uso del criterio (A) è da bandire.

10) I risultati del calcolo vanno sempre considerati come largamente approssimativi e non è possibile precisare il grado di scostamento di essi dalla realtà, specialmente nei confronti internazionali (cfr. par. 20). Per questi ultimi occorre anche tener presente, fra l'altro, la sensibile divergenza che può esistere nel calcolo della potenza « praticamente » utilizzabile dei motori idraulici in confronto a quella degli altri tipi di motori primari (cfr. par. 22).

11) È opportuno che il calcolo della potenza utilizzabile si estenda alle macchine in riserva. Si ritiene che debbano considerarsi tali le macchine installate al solo scopo di sostituire le altre in caso di guasti o riparazioni. Le macchine installate per far fronte a bisogni eccezionali di punta e le macchine temporaneamente inattive (per ragioni economiche) al momento del censimento, si dovranno pertanto considerare ai fini del calcolo come macchine attive (cfr. par. 23).

12) Per tentare di colmare una grave lacuna esistente nelle nostre statistiche industriali si sono calcolati congetturalmente i dati sulla potenza teoricamente utilizzabile in Italia per i cinque scopi fondamentali e per grandi rami di attività (cfr. par. 25 prosp. 7) intorno all'anno 1938.

La potenza « teoricamente » utilizzabile riferita al luogo di consumo varia da un *minimo* di 8.000.000 di CV (contro 6.950.000 CV in termini di potenza primaria riferita al luogo di produzione) per lo scopo primo (*azionare il macchinario*) a un *massimo* di oltre 38.000.000 di CV (contro 35.000.000 in termini di potenza primaria) per lo scopo terzo (*qualsiasi uso, compresi tutti i mezzi di trasporto.*).

Escludendo dal calcolo la potenza dei mezzi di trasporto (non elettrici) il dato riferito al luogo di consumo varia dal suddetto minimo di 8 milioni di CV (scopo primo) — 6.950.000 in termini di potenza primaria — ad un massimo di 14.220 per lo scopo quarto e cioè per *qualsiasi uso esclusi i trasporti elettrici* (pari a 11 milioni di CV in termini di potenza primaria).

Allegato

Schema di questionario tipo per la rilevazione dei motori primari, generatori e motori elettrici, «fissi».

MOTORI PRIMARI, GENERATORI, MOTORI ELETTRICI (Esclusi i motori dei mezzi di trasporto). — ENERGIA ELETTRICA

I **motori primari** utilizzano le energie naturali del vento, dell'acqua, del vapore, dei carburanti gassosi (gasluce, metano, ecc.), dei carburanti liquidi (olio pesante, nafta, benzina, alcool, miscele, ecc.) e le trasformano in *energia meccanica*. Essi possono essere destinati ai seguenti usi: *a*) azionare *direttamente ed esclusivamente* il macchinario (mediante trasmissioni, funi, cinghie, ingranaggi, giunti, snodi, ecc.); *b*) azionare *direttamente ed esclusivamente* i generatori elettrici cui sono meccanicamente accoppiati (gruppi elettrogeni) *c*) azionare *promiscuamente* tanto il macchinario quanto generatori elettrici.

I **generatori elettrici** utilizzano l'energia meccanica dei motori primari cui sono accoppiati e la trasformano in *energia elettrica*.

I **motori elettrici** sono alimentati da energia elettrica (prodotta all'interno dell'esercizio censito, oppure acquistata), che trasformano in *energia meccanica* per azionare macchine, attrezzi, utensili, ecc.

AVVERTENZE GENERALI

1. — NON DEBBONO ESSERE CENSITI:
   a) i motori primari accoppiati a generatori (gruppi elettrogeni) installati FUORI dallo stabilimento od esercizio censito con il presente questionario (anche se l'energia elettrica prodotta fosse *tutta* destinata allo stabilimento od esercizio stesso). Essi saranno censiti a parte come produttori di energia elettrica, tuttavia di essi sarà fatta menzione al quesito 3 - Energia elettrica.
   b) le macchine che trasformano energia elettrica in altra energia elettrica con caratteristiche diverse, sia che si tratti in generale di *commutatrici, trasformatori* (elevatori o riduttori) e simili o di gruppi motori elettrici-generatori, o di *eccitatrici* (negli impianti idrotermoelettrici) ecc.
   c) i motori o generatori eventualmente esistenti come scorta di magazzino, ma non materialmente installati sul posto e pronti a funzionare.
2. — MOTORI PRIMARI, GENERATORI E MOTORI ELETTRICI **in riserva** (ultima riga del Prosp. I). — Si considerano *in riserva* quelli che sono installati nello stabilimento, e pronti a funzionare, in caso di mancato funzionamento degli altri motori o generatori per guasti improvvisi, riparazioni e simili. — Tutti gli altri motori — compresi quelli che sono destinati soltanto a far fronte a bisogni momentanei di punta o a sovraccarichi eccezionali — NON *debbono mai essere considerati in riserva*. Pertanto anche i motori o generatori temporaneamente *inattivi* per ragioni economiche (inattività stagionale, crisi economiche, ecc.) NON debbono essere considerati *in riserva*.

1. — Motori primari e generatori elettrici. — Per tutti i motori primari e generatori elettrici (compresi quelli inattivi totalmente o parzialmente), installati come impianti fissi, nel giorno del censimento si dovrà compilare il seguente prospetto, dopo aver letto attentamente le seguenti *avvertenze speciali* e le note in calce al prospetto stesso.

AVVERTENZE SPECIALI PER MOTORI PRIMARI E GENERATORI.

1) POTENZA DEI MOTORI PRIMARI (col. 3, col. 5, col. 7, col. 9 del prospetto I). La potenza deve essere sempre indicata in cavalli vapore (Cv.). *Quando la potenza di qualche motore sia espressa* (sulla targa o sui documenti della ditta costruttrice, ecc.) *in kW, il censito dovrà trasformare i kW in Cv moltiplicando i primi per il coefficiente* 1,36.

— Per i *motori a vento* indicare la potenza in Cv, quale risulta dalle caratteristiche tecniche costruttive riferite ad un rendimento *medio* del motore calcolato in relazione ad un *vento medio*.

— Per le *ruote idrauliche* (per di sopra, per di sotto, di fianco, ritrecine) si indicherà la potenza in Cv. del salto di acqua quale risulta dal *decreto di concessione del Ministero dei Lavori Pubblici*.

— Per le *turbine idrauliche* si indicherà la potenza *utile* (o normale o media o contrattuale) quale risulta dalle caratteristiche tecniche indicate dalla ditta costruttrice o risultante dalla *targa* eventualmente applicata o altrimenti accertata.

— Per i *motori a vapore* (a stantuffo o turbine) si indicherà la potenza meccanica *normale* in Cv, quale risulta dalla targa, o quando questa non esista, dalle caratteristiche indicate dalla ditta costruttrice o altrimenti accertate. *Qualora nella targa figurino due indicazioni di potenza, indicare la cifra minore.*

— Per i *motori a combustione interna* (a gas, a olio pesante, a benzina, alcool, ecc.) si indicherà la potenza *effettiva* o utile in Cv quale risulta dalla *targa* applicata al motore o, quando tale indicazione non esiste, in base alle caratteristiche indicate dalla ditta costruttrice o altrimenti accertata.

2) POTENZA DEI MOTORI PRIMARI ACCOPPIATI A GENERATORI (col. 5 del prospetto I). Qualora non sia nota la potenza in Cv dei motori primari azionanti direttamente ed esclusivamente i generatori elettrici, il censito indicherà la potenza dei generatori cui sono accoppiati: se questa è indicata in kW trasformerà questi in Cv moltiplicando i primi per il coefficiente 1,36; se è indicata in kVA trasformerà prima questi in kW (vedi avvertenza seguente) e poi i kW in Cv.

3) POTENZA DEI GENERATORI ELETTRICI (col. 11 del prospetto I). La *potenza dei generatori elettrici* è quella normale o effettiva che risulta dalla targa applicata ai generatori stessi. Quando la potenza indicata sulla targa è espressa (per i generatori a corrente alternata) in kVA, il censito trasformerà i kVA in kW moltiplicando i primi per il cos φ quale risulta dalla targa stessa, o, in mancanza, per il coefficiente medio 0,8.

PROSPETTO I. — *A*) MOTORI PRIMARI - *B*) GENERATORI ELETTRICI

SPECIE DEI MOTORI PRIMARI INSTALLATI	*A*) MOTORI PRIMARI (*Comprese le riserve*)								*B*) GENERATORI ELETTRICI (*comprese le riserve*)	
	azionanti:									
	direttamente ed esclusivamente:				promiscuamente tanto il macchinario quanto generatori elettrici		in complesso		secondo la specie dei motori primari che li azionano	
	il *macchinario*		*generatori elettrici* (gruppi elettrogeni)

TOTALE (*comprese le riserve*). . .		Cv.		Cv.		Cv.		Cv.		kW.
di cui in riserva (4)		Cv.		Cv.		Cv.		Cv.		kW.

(1) Cfr. avvertenza speciale n. 1. — (2) Qualora non sia nota la potenza in Cv del motore primario indicare quella del generatore cui accoppiato, trasformando i kW o i kVA del generatore in Cv.(Cfr. avvertenza speciale n. 2). — (3) Qualora la potenza sia indicata in kVA, trasformarla in kW, moltiplicando i primi per il cos φ, o, in mancanza, per il coefficiente 0,8. (Cfr. avvertenza speciale n 3). (4) Si considerano in riserva se destinati a funzionare *soltanto* in caso di guasto, riparazioni ecc., degli altri motori (cfr. avvertenze generali n. 2),

MOTORI ELETTRICI

2. — **Motori elettrici.** — Tutti i motori elettrici, installati il giorno di censimento (compresi quelli inattivi, totalmente o parzialmente, per ragioni economiche ed inclusi quelli accoppiati direttamente a macchine, attrezzi, utensili, ecc., *anche se di potenza minima*), debbono essere indicati nel seguente prospetto dopo aver letto attentamente le seguenti avvertenze speciali.

AVVERTENZE SPECIALI PER MOTORI ELETTRICI.

1) Non debbono essere censiti i motori elettrici accoppiati a generatori allo scopo di trasformare energia elettrica in altra energia elettrica con diverse caratteristiche. cfr. avvertenza generale n. 1 lettera *b*.

2) Motori elettrici in riserva: cfr. avvertenza generale n. 2.

3) La potenza dei motori elettrici è quella indicata sulla targa (o altrimenti accertata) e deve essere espressa in cavalli vapore Cv. Qualora sulla targa figuri soltanto l'indicazione in kW il censito dovrà trasformare i kW in Cv moltiplicando i primi per il coefficiente 1,36.

4) È indispensabile ndicare separatamente: *a*) i motori elettrici azionati esclusivamente da elettricità prodotta da generatori installati nello stabilimento od esercizio censito con il presente questionario; *b*) i motori elettrici azionati con energia elettrica acquistata (o proveniente da generatori installati in altri stabilimenti od esercizi della stessa ditta); *c*) i motori azionati promiscuamente da energia elettrica prodotta e non prodotta nello stabilimento od esercizio censito con il presente questionario.

PROSPETTO II. — MOTORI ELETTRICI

MOTORI ELETTRICI:	IN COMPLESSO		DI CUI IN RISERVA (2)	
	N.	Potenza complessiva (1)	N.	Potenza complessiva (1)
a) azionati *esclusivamente* da elettricità prodotta nell'esercizio.	.....	Cv.	.....	Cv. .....
b) azionati *esclusivamente* da elettricità *non* prodotta nell'esercizio.	.....	Cv.	.....	Cv. .....
c) azionati *promiscuamente*	.....	Cv.	.....	Cv. .....
TOTALE. . .	.....	Cv.	.....	Cv. .....

(1) Qualora la potenza sia espressa in kW, trasformarla in Cv moltiplicando i primi per il coefficiente 1,36.
(2) Cfr. avvertenza generale n. 2: si considerano in *riserva* quelli destinati a funzionare *soltanto* in caso di guasto, riparazioni, ecc. agli altri motori

ENERGIA ELETTRICA

3. — Esistono *gruppi elettrogeni* (motore primario-generatore) di proprietà della ditta cui appartiene lo stabilimento o l'esercizio censito con il presente questionario, ma *installati FUORI dello stabilimento od esercizio* stesso (*Cfr. Avvertenza generale n.* 1, *a*), che destinino a questo tutta o parte della energia elettrica prodotta? (si o no). . . . . In caso affermativo indicare: la potenza complessiva dei generatori: kW. . . . . .; il Comune dove sono installati i gruppi: Comune di. . . . . Via. . . . . N. . . .

4. — Compilare accuratamente il seguente prospetto indicando i dati complessivi relativi *all'anno di censimento* corrispondenti alla prima riga « Complesso k Wh » e, dove possibile, anche i dati sottostanti corrispondenti alle principali destinazioni dell'energia elettrica.

PROSPETTO III. ENERGIA ELETTRICA

INDICAZIONI	ENERGIA ELETTRICA (in kWh):			
	prodotta nello:	venduta o ceduta (1) dallo:	acquistata o ritirata (2) dallo:	consumata (col. 2 meno col. 3 più col. 4) dallo:
	stabilimento od esercizio censito con il presente questionario			
1	2	3	4	5
COMPLESSO. . . . . kWh	.....	.....	.....	.....
DI CUI (3):				
1) per forza motrice . . . . . kWh	.....	.....	.....	.....
2) per usi termici (forni elettrici, fusioni, ecc.). kWh	.....	.....	.....	.....
3) per elettrolisi. . . . . kWh	.....	.....	.....	.....
4) per illuminazione. . . . . kWh	.....	.....	.....	.....
5) per trazione elettrica. . . . . kWh	.....	.....	.....	.....
6) per altri usi. . . . . kWh	.....	.....	.....	.....

(1) La cessione di energia elettrica ad altri stabilimenti od esercizi della stessa ditta (anche se gratuitamente) va considerata come venduta.
(2) L'energia ritirata (anche se gratuitamente) da altri stabilimenti od esercizi della stessa ditta va considerata come acquistata.
(3) Qualora non sia possibile fornire le indicazioni richieste per tutti gli usi indicati, fornire *almeno* i dati relativi ad uno o più di detti usi e in particolare, per forza motrice (esclusa la trazione elettrica).

APPENDICE V

CLASSIFICAZIONE DELLE INDUSTRIE E DEI SERVIZI

N. d'ordine definitivo della sottoclasse	Data di censimento	Classi e sottoclassi	Num. d'ordine provvisorio della sottoclasse	Num. del modello di questionario
		A) INDUSTRIE		
		I. - INDUSTRIE DELLA PESCA		
1	10 maggio 1937	**Pesca in acque marine** (esclusa la pesca del tonno con tonnare: sottoclasse 2, e gli allevamenti di pesci e molluschi bivalvi in acque marine: sottoclasse 3). a) **Pesca da terra, con o senza apparecchi collocati lungo il litorale.** b) **Pesca con naviglio.**	1	 1 2
2	25 giugno 1937 15 settembre 1937	**Pesca del tonno con tonnare** (1) (tonnare di corsa, tonnarelle e tonnare di ritorno).	2	9 25
3	10 maggio 1937	**Allevamenti di pesci e molluschi bivalvi in acque marine** (valli salse, laghi costieri, stagni litoranei, peschiere e lagune).	3	4
4-5	idem	**Pesca e allevamenti in acque interne**, (esclusi gli allevamenti esercitati da dilettanti).	4–5	5
		II. - INDUSTRIE ESTRATTIVE		
6	30 giugno 1938	**Ricerche di giacimenti di minerali metallici e di minerali di solfo.**	11	59
6*bis*	idem	**Ricerche di giacimenti di minerali non metallici** (compresi i combustibili, le acque minerali, ecc.; esclusi i minerali di solfo: sottoclasse 6).	11*bis*	61
7	idem	**Miniere di minerali metallici con eventuali annesse prime lavorazioni dei minerali** (ad es.: la frantumazione, la macinazione, gli altri processi di arricchimento dei minerali; il lavaggio, la classificazione, calcinazione ed essiccazione dei minerali) (2).	12	59
8	idem	**Miniere di minerali non metallici** (escluso il solfo ed i combustibili fossili: sottoclassi 9 e 10) **con eventuale annessa classificazione, macinazione e frantumazione** (2).	13	61
9	idem	**Miniere di solfo con eventuale annessa molitura e fusione del solfo.**	14	59
10	idem	**Miniere di combustibili fossili e cave di torba con eventuale annessa produzione di mattonelle e ovuli combustibili** (2).	15	61
11	idem	**Miniere di combustibili liquidi e gassosi anche con eventuale compressione** (2).	16	61
12	idem	**Cave di marmo, pietra da taglio, pietre grezze da costruzione con eventuale annessa frantumazione o macinazione ed altre lavorazioni complementari** (ad es.: prima sbozzatura, squadratura e taglio dei blocchi di marmo e pietre, compresa la segazione dal monte, esclusa la segazione in lastre) (2).	17	61
13-14	idem	**Cave e miniere di pietra per macchine ed attrezzi e di materiale per uso industriale** (pietra litografica, da macina, molare, coti; sabbie silicee; terre da follare o decoloranti, da modellare o per fonderia, ecc.); **di materiale da cementi, laterizi, terrecotte, porcellane; di argille e materie refrattarie; di materiale per vetrerie e simile con eventuale annessa frantumazione e/o macinazione** (2) (3) (escluse le cave e miniere di materiale per costruzione: sottoclasse 12; e le cave annesse a fornaci e molini per gesso, calce e cemento: sottoclasse 142; a fornaci per laterizi e a produzione di laterizi crudi: sottoclasse 143).	18–19	61
15	idem	**Cave di sabbia, ghiaia e pietrisco con eventuale annessa macinazione e classificazione** (escluse le cave annesse a fornaci e molini per calce, gesso e cemento: sottoclasse 142; e a fornaci per laterizi: sottoclasse 143) (2) (3).	20	61
16	31 ottobre 1938	**Produzione di sale marino e sale di ebollizione** (esclusa la eventuale annessa utilizzazione delle acque madri).	21	195
17	30 giugno 1938	**Concessioni di sorgenti di acque minerali** (comprese le concessioni delle sorgenti annesse a stabilimenti idropinici e idrotermali).	23	61
		III. - INDUSTRIE DEL LEGNO E AFFINI		
18	30 novembre 1938	**Produzione di carbone vegetale** (esclusa la produzione fatta da aziende che provvedono alla prima lavorazione del legno e quella proveniente dalla distillazione secca del legno).	29	222

(1) Il censimento è stato eseguito in due tempi: il 25 giugno 1937 per le tonnare di corsa e tonnarelle; il 15 settembre 1937 per le tonnare di ritorno.

(2) Sono state escluse le prime lavorazioni non eseguite presso le miniere, e le industrie chimico-estrattive, chimico mineralogiche o le industrie metallurgiche anche se impiantate presso le miniere.

(3) Le cave sono state considerate annesse ad una fornace o molino anche se dislocate in comune diverso, purchè appartenenti allo stesso proprietario o gestore e i prodotti della cava utilizzati dalla fornace o molino.

N. d'ordine definitivo della sottoclasse	DATA DI CENSIMENTO	CLASSI E SOTTOCLASSI	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue: **III. - Industrie del legno e affini.**		
19	31 dicembre 1938	**Prima lavorazione del legno** (comprese le segherie all'aperto nei luoghi di produzione) **e lavorazioni affini** (produzione di pali, traverse, legname segato, doghe, abbozzi ; produzione di truciolo e lana di legno ; produzione di agglomerati di fibre legnose, stagionatura artificiale e conservazione del legname) ; **fabbricazione di compensati e paniforti ; fabbricazione di imballaggi, gabbie, ceste, ecc.** (escluse : le lavorazioni relative all'abbattimento e alla troncatura delle piante fatte come attività accessorie ; il montaggio delle casse, fusti e gabbie da imballaggio, partendo da elementi scomposti per imballaggio e le lavorazioni per ottenere legna da ardere eseguite da ditte o da artigiani specializzati).	30	223 223*bis*
20	idem	**Fabbriche di botti, di fusti e di altri recipienti di legno : tini, vasche, mastelli, ecc.** (esclusi i fusti di legno per imballaggio e il montaggio di fusti per imballaggio : sottoclassi 19 e 21).	31	224 224*bis*
21	idem	**Laboratori da falegname ; carpenteria in legno ; fabbricazione di serramenti e di persiane avvolgibili** (fabbricazione di pavimenti in legno, di scale, di casse da morto, di bauli di legno ; montaggio di casse, fusti e gabbie da imballaggio ; esclusa la preparazione dei legnami d'opera : sottoclasse 19).	32	225 225*bis*
22	idem	**Costruzione e riparazione di veicoli in legno** (esclusi i veicoli ferroviari : sottoclasse industrie meccaniche).	33	226
23	idem	**Costruzione e riparazione di barche, navi e natanti in legno, compreso il calafataggio e l'eventuale annessa installazione di motori.**	34	227
24	idem	**Fabbriche di mobili comuni e di lusso ; di arredamenti in legno ; di aste per cornici ; di bigliardi ; di oggetti artistici in legno** (compresa l'annessa lucidatura, laccatura e doratura ; esclusi i mobili in canna, giunchi e vimini : sottoclasse 26).	35	228 228*bis*
24*bis*	idem	**Lucidatura di mobili, laccatura, doratura eseguite in laboratori specializzati** (non annessi a fabbriche di mobili).	35*bis*	229
25	idem	**Fabbricazione di utensili, attrezzi e accessori in legno o prevalentemente in legno ; di oggetti vari in legno ; di parti elementari di oggetti complessi e di giocattoli in legno.**	38	230 230*bis*
26	idem	**Lavorazione di canne palustri, vimini, giunchi e simili** (compreso l'eventuale annesso imbianchimento e laccatura) ; **rivestimento dei recipienti di vetro ; fabbricazione di corde e tappeti di cocco, eseguita in via accessoria negli esercizi che fabbricano fiscoli per spremitoi di olio** (escluse le fabbricazioni di ceste, cestini, sporte, scatole, ecc. in truciolo e legno tranciato, per frutta e verdura).	40	231 231*bis*
27	idem	**Preparazione del crine vegetale, della trebbia e simili ; lavorazione della paglia** (con eventuali annesse lavorazioni di imbianchimento e tintura), **dello sparto e simili** (esclusa la lavorazione del crine : sottoclasse 262 ; i laboratori per il rivestimento dei recipienti di vetro e la fabbricazione dei mobili in giunco, canna e vimini : sottoclasse 26 ; la fabbricazione di oggetti di abbigliamento : classe XIV).	41	232
28	idem	**Fabbricazione di scope con eventuale annessa fabbricazione a mano di spazzole e pennelli di trebbia, saggina, ecc.** (esclusa la fabbricazione a macchina di spazzole, pennelli, ecc. : sottoclasse 263 ; e la fabbricazione a mano di scope fatta a domicilio, saltuariamente, senza dipendenti e senza alcuna particolare attrezzatura).	43	233
29	idem	**Lavorazione del sughero** (esclusa sempre la raccolta ; escluse le operazioni preliminari — prima bollitura, raschiatura, rifilatura, classifica — quando non eseguite nello stesso stabilimento della lavorazione del sughero, ed esclusa la fabbricazione di tappi corona, anche se eseguita nello stabilimento di lavorazione del sughero).	44	234
30	idem	**Produzione di farina di legno e legno macinato.**	45	235
		IV. - INDUSTRIE ALIMENTARI		
31	1° agosto 1937	**Esercizio di macchine agrarie per conto terzi** (con o senza noleggio, escluso il semplice noleggio di macchine agrarie : censimento commerciale).	52	14
32	idem	**Trebbiatrici** (azionate meccanicamente o a mano) **e sgranatrici** (azionate solo meccanicamente) **per cereali, leguminose da seme e semi minuti** (in uso esclusivo dell'azienda del proprietario o usate nella trebbiatura per conto terzi, ovvero noleggiate o comunque cedute temporaneamente a terzi).	53	15

Segue: *Appendice V — Classificazione delle Industrie e dei Servizi*

N. d'ordine definitivo della sottoclasse	Data di censimento	Classi e sottoclassi	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue: **IV. - Industrie alimentari.**		
33	15 ottobre 1937	**Magazzini di raccolta, deposito e conservazione di cereali ed altri semi per conto terzi** (grano, granturco, risone, riso, avena, segala, orzo), **lavorazione per conto terzi di cereali ed altri semi** (escluse la pilatura e brillatura del riso: sottoclasse 34; gli ammassi granari, i magazzini generali e le lavorazioni accessorie del commercio o preliminari alla molitura o comunque limitate a dare al prodotto carattere di commerciabilità semprechè non eseguite per conto terzi).	54	26
34	30 novembre 1937	**Pilatura, brillatura ed altre lavorazioni del riso** (oleatura, raffinazione, ecc.); **pilatura, perlatura, brillatura, fioccatura di cereali e legumi** (escluse le lavorazioni casalinghe, le lavorazioni eseguite senza l'uso di speciale attrezzatura e la pulitura, l'oleazione ed altre lavorazioni per il ricupero di partite avariate, la classificazione e selezione meccanica di cereali e legumi).	55	37
35-36	15 ottobre 1937	**Molini da cereali a laminatoio e a palmenti** (esclusi i molini destinati a macinare cereali per esclusivo uso della famiglia o della azienda del conduttore, e quelli senza licenza).	56–57	28
37-38	30 novembre 1937	**Forni per panificazione con o senza annessa vendita al minuto** (compresi i forni rustici anche se sprovvisti di licenza e quelli esistenti presso convivenze, esclusi i forni privati ubicati nelle case di abitazione e quelli esistenti presso gli alberghi).	58–59	38
39	idem	**Pastifici** (anche con eventuale annessa parziale vendita al minuto).	60	39
39*bis*	idem	**Produzione di paste fresche e affini annessa a negozi di vendita al minuto.**	60*bis*	40
40-41	idem	**Produzione di biscotti, panettoni e pasticcerie diverse, con o senza annessa vendita al minuto** (escluse le lavorazioni casalinghe e le lavorazioni eseguite eccezionalmente dai forni in base ad autorizzazione prefettizia).	61–62	41
42-42*bis*	15 ottobre 1937	**Lavorazione del cacao, produzione di cioccolata, caramelle, torroni, e confetture diverse con o senza annessa vendita al minuto** (esclusa la produzione di cioccolata eseguita nelle pasticcerie a esclusivo sussidio della loro produzione di paste e dolciumi).	63-63*bis*	30 32
43	idem	**Pubblici macelli.**	64	33
44-44*bis*	idem	**Esercizi per la conservazione e lavorazione delle carni e per la colatura e filtrazione dei grassi animali** (escluse le altre lavorazioni di materie grasse: sottoclasse 173; e gli stabilimenti per la preparazione degli estratti di carne: sottoclasse 63) **con o senza annessa vendita al minuto.**	65-65*bis*	34 36
45-45*bis*	1° agosto 1937	**Produzione di gelati con o senza annessa vendita al minuto.**	66-66*bis*	16
46	30 giugno 1937	**Lavorazione e conservazione dei prodotti alimentari della pesca** (escluso il baccalà: sottoclasse 47).	67	10
47	idem	**Stabilimenti per la conservazione e la lavorazione del baccalà.**	68	12
48	30 novembre 1937	**Produzione di mangimi** (esclusa la produzione di mangimi ottenuta come sottoprodotto).	69	51
49	1° agosto 1937	**Stabilimenti per la conservazione e trasformazione di frutta, ortaggi, funghi e prodotti similari** (1).	70	18
49*bis*	idem	**Essiccazione delle castagne.**	70	18
50-50*bis*-51	25 maggio 1937	**Stabilimenti per la lavorazione del latte** (comprese le lavorazioni del latte annesse ad aziende agrarie o zootecniche o presso malghe purchè effettuate in locali attrezzati esclusivamente per la lavorazione del latte); **centrali di pastorizzazione del latte; lavorazioni presso aziende di greggi transumanti** (escluse le lavorazioni casalinghe e le fabbriche di burro artificiale: sottoclasse 173).	71-71*bis*-72	6 7
52	30 novembre 1937	**Frantoi per olive a forza inanimata** (compresi gli esercizi per l'esclusiva lavatura delle sanse, o il rimacino ed esclusi i frantoi per olive annessi, come impianti secondari, sussidiari e collaterali, a stabilimenti per la estrazione dell'olio dalle sanse con solventi o per la raffinazione degli olii); **frantoi per olive a forza animata** (2).	73	42
53	idem	**Produzione di vini e aceti** (3) (esclusa la semplice pigiatura dell'uva per conto terzi).	74	45

(1) In questa sottoclasse, per una errata interpretazione delle norme, sono stati censiti molti esercizi che effettuavano soltanto la essiccazione delle castagne, senza possedere una vera e propria attrezzatura industriale. Non essendo stato possibile, in sede di revisione, di individuare tali esercizi, si è venuto nella determinazione di stralciare tutti gli esercizi che effettuavano soltanto l'essiccazione delle castagne, qualunque fosse l'attrezzatura industriale e di pubblicare i dati nella sottoclasse 49 *bis*.

(2) I frantoi per olive a forza animata, a ruota o a ritrecina sono stati rilevati separatamente mediante apposita indagine speciale promossa dal P.N.F. ed eseguita dall'Istituto Centrale di Statistica, con riferimento allo stesso anno di censimento.

(3) Il censimento è stato limitato: *a*) ai produttori di vino (anche agricoltori o commercianti) che disponevano di vasi vinari per una capacità complessiva di almeno 500 ettolitri; *b*) ai produttori di aceto che disponevano di tini acetificatori per una capacità complessiva di almeno 100 ettolitri; *c*) a tutti coloro senza eccezione, che eseguivano la concentrazione dei mosti, od altre speciali lavorazioni; *d*) ai produttori di vermut o aperitivi a base di vino.

		Segue: **IV. - Industrie alimentari.**		
54	30 novembre 1937	**Distillerie di alcole di 2ª categoria e produzione di acquaviti e liquori.**	75	46
55	1º agosto 1937	**Stabilimenti per la produzione del malto** (esclusa la produzione dei vini e dell'aceto: sottoclasse 53).	76	21
56	idem	**Stabilimenti per la produzione della birra.**	77	21
57	idem	**Stabilimenti per la produzione degli estratti di malto.**	78	21
58	idem	**Stabilimenti per la produzione di bevande gassate, seltz ed acque minerali artificiali** (esclusa la produzione eseguita dai bar, caffè e simili per somministrazione al banco e considerata accessoria all'attività principale).	79	19
59	30 novembre 1937	**Lavorazione dei semi non oleosi, dei legumi, delle castagne, e delle droghe** (esclusa l'essiccazione: sottoclassi 49 e 49 *bis*).	80	47
60-61	idem	**Torrefazione del caffè** (anche annessa ad esercizi commerciali) **e altre lavorazioni del caffè** (1).	81-82	48
62	idem	**Fabbricazione dei surrogati del caffè** (2).	83	49
63	idem	**Produzione di estratti, dadi e brodi concentrati, animali, vegetali e misti** (esclusi gli estratti di malto: sottoclasse 57).	84	50
64	25 agosto 1937	**Stabilimenti per la produzione e la raffinazione dello zucchero.**	85	23
65	1º agosto 1937	**Stabilimenti per la lavorazione del miele.**	86	17
66-67	idem	**Stabilimenti frigoriferi e fabbriche di ghiaccio** (3).	87-88	20
68	30 novembre 1937	**Frantoi per semi oleosi** (esclusi i frantoi che procedevano anche all'estrazione dell'olio da semi con solventi o alla raffinazione dell'olio di semi).	90	43
69	idem	**Produzione e raffinazione (rettificazione) di olii vegetali.**	91	44
		V. - INDUSTRIE METALLURGICHE		
70	30 giugno 1938	**Stabilimenti per la produzione della ghisa, dell'acciaio e delle ferroleghe.**	98	62
71	idem	**Stabilimenti per la prima lavorazione del ferro e dell'acciaio** (compresi lamiere e lamierini laminati a freddo; escluse le costruzioni metalliche e la fabbricazione di materiali metallici per applicazioni varie; le officine per tempera, cementazione e trattamento superficiale dei metalli; le officine per la saldatura elettrica ed autogena e per il taglio con fiamma ossidrica ed ossiacetilenica).	99	63
72	idem	**Stabilimenti per la produzione di pezzi di acciaio, fucinati e stampati a caldo** (esclusi i reparti di fucinatura e stampatura esistenti negli stabilimenti meccanici; la stampatura e imbutitura a freddo dei pezzi di acciaio; la produzione di punte, chiodi, bullonerie e viterie; la produzione di ferramenta minute e minuterie metalliche).	100	64
73	idem	**Stabilimenti per la trafilazione e laminazione a freddo del ferro e dell'acciaio** (esclusi lamiere e lamierini laminati a freddo; la produzione di funi e corde metalliche dal filo di acciaio; la sagomatura del nastro di acciaio).	101	67
74	idem	**Stabilimenti per la produzione dei metalli diversi dal ferro e delle loro leghe** (esclusa la produzione dei metalli suindicati ottenuti come sottoprodotti nelle industrie chimiche; la imbutitura a freddo e le fonderie di 2ª fusione).	102	68
75	idem	**Stabilimenti per la prima lavorazione dei metalli diversi dal ferro e delle loro leghe** (laminazione, trafilazione, estrusione, fucinazione, stampatura) (esclusa la imbutitura a freddo e le fonderie di 2ª fusione).	103	69
76	idem	**Catenifici** (esclusa la produzione di catene derivate dal filo; di catene a piastra, a rulli e simili e di catenelle per minuteria metallica).	105	66
		VI. - INDUSTRIE MECCANICHE		
77	31 ottobre 1938	**Artigiani meccanici.**	—	203
78 a 123 **125 a 137**	30 settembre 1939	**Stabilimenti meccanici** (comprendono) (4).	113 a 158 160 a 176	276 stab. (5)
	idem	A) **Fonderie di seconda fusione** (Fonderie di ghisa di 2ª fusione — Fonderie di metalli non ferrosi di 2ª fusione).		

(1) Il censimento in questione è stato limitato ai soli esercizi aventi diritto al contingentamento del caffè e che provvedevano alla torrefazione ed eventualmente ad altre lavorazioni industriali del caffè (per es. la decaffeinizzazione) o alla semplice torrefazione del caffè presso esercizi commerciali. Sono stati esclusi gli esercizi che eseguivano la torrefazione del caffè acquistando il caffè dagli aventi diritto al contingentamento.

(2) Il censimento è stato limitato ai soli esercizi muniti dell'apposita licenza di fabbricazione.

(3) Negli stabilimenti frigoriferi sono stati censiti solamente gli esercizi che provvedevano alla refrigerazione per conto terzi, esclusi i frigoriferi dei magazzini generali e dei mercati rionali. Gli esercizi che svolgevano entrambe le attività dell'industria del freddo sono stati considerati come due unità di censimento.

(4) Gli stabilimenti con meno di 10 addetti sono stati considerati d'ufficio come esercizi artigiani, e conglobati con gli analoghi esercizi artigiani censiti il 31 ottobre 1938.

(5) Numero dei questionari di esercizio: dal 277 al 322 e dal 324 al 333 (da quest'ultimo questionario sono stati stralciati i dati del gruppo *S*).

	30 settembre 1939	*Segue :* **Stabilimenti meccanici.**		
	idem	N) **Monete, medaglie, ecc. ; gioielleria, oreficeria, ecc.** (Coniazione di medaglie, monete, targhe, distintivi, decorazioni e incisione di metalli — Fabbricazione di gioielleria, oreficeria, argenteria e affini).		
	idem	O) **Mezzi di trasporto** (Costruzione o montatura di velocipedi, compresa la costruzione di parti di velocipedi — Costruzione o montatura di motoveicoli e mototelai, compresa la costruzione di parti di motoveicolo — Costruzione di autoveicoli e autotelai — Costruzione di trattori, di locomobili e di rulli compressori stradali — Costruzione di carrozzerie e di rimorchi per auto e motoveicoli e per vetture filoviarie — Costruzione di autoveicoli speciali — Costruzione di parti e accessori di autotelai, mototelai, rimorchi, aviomotori e di altri motori a combustione interna in genere — Costruzione di materiale rotabile ferro-tramviario — Costruzione e riparazione di aeromobili — Cantieri navali per costruzioni metalliche).		
	idem	P) **Generazione, trasformazione, trasporto, utilizzazione e misurazione dell'energia elettrica** (Costruzione di macchine, apparecchi ed apparecchiature elettriche per la generazione, la trasformazione, il trasporto a distanza e l'utilizzazione dell'energia elettrica ; di apparecchi elettromedici e roentgenologici in genere ; di accumulatori elettrici e pile elettriche — Costruzione o montatura di apparecchi per impianti telegrafici, telefonici, elettroacustici e di telecomunicazione in genere — Costruzione o montatura di apparecchi per radiotelefonia, radiotelegrafia, amplificazione sonora e televisione e di fonografi — Costruzione di apparecchi e strumenti elettrici per misure elettriche, radioelettriche e industriali varie).		
	idem	Q) **Altre industrie meccaniche sopra non contemplate.**		
	idem	R) **Lavorazioni meccaniche generiche** (Officine per la riparazione di auto e moto-veicoli, di trattori e di vetture filoviarie — Fonderie per il recupero di metalli non ferrosi — Lavori di picchettaggio e coloritura di navi — Officine di fucinatura, stampatura e imbutitura — Officine per lavorazioni meccaniche generiche — Officine per la saldatura elettrica, allumino-termica e ossiacetilenica e per il taglio con fiamma ossidrica od ossiacetilenica — Officina per tempera, cementazione e trattamenti superficiali dei metalli, compresi i trattamenti elettrogalvanici).		
	idem	S) **Installazioni di impianti** (Installazione di impianti effettuata da ditte costruttrici di macchinario).		
137*bis*	idem	**Officine di riparazione per materiale fisso e mobile delle Ferrovie dello Stato**	500	276 stab. (1)
124	idem	**Demolizioni di navi.**	159	323
137*ter*	idem	**Imprese installazione di impianti** (escluse le installazioni effettuate da ditte costruttrici di macchinario).	176	333 (2)
		VII. - INDUSTRIE CHE LAVORANO I MINERALI NON METALLICI		
138	30 giugno 1938	**Stabilimenti per la macinazione e il lavaggio dei minerali, con eventuale annessa calcinazione** (3) (esclusi quelli annessi alle miniere : classe II ed i molini da gesso e da calce : sottoclasse 142).	186	70
139	idem	**Cantieri da scalpellino** (esclusi quelli annessi alle cave), **segherie di pietra** (compresa l'eventuale levigatura, esclusa la segagione a monte e la prima sbozzatura dei marmi e delle pietre e la segagione e lavorazione dei conglomerati artificiali) **e lavorazione delle pietre per uso industriale : mole, lavagne, macine, pietre coti, ecc.** (escluse le mole a smeriglio e le macine artificiali : sottoclasse 147).	187	71 71*bis*
140	idem	**Laboratori per la lavorazione artistica dei marmi e delle pietre.**	188	72 72*bis*
141	idem	**Stabilimenti per la lavorazione delle pietre dure e delle pietre preziose per uso industriale.**	189	73
141*bis*	idem	**Laboratori per la lavorazione delle pietre dure e delle pietre preziose per gioielleria** (compresi i laboratori per la sola riparazione).	189*bis*	74

(1) Questionario speciale.
(2) Vedi nota (5) a pag. 82*.
(3) Escluse le macinazioni annesse ad esercizi commerciali.

N. d'ordine definitivo della sottoclasse	DATA DI CENSIMENTO	CLASSI E SOTTOCLASSI	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue: **VII. - Industrie che lavorano i minerali non metallici.**		
142	30 giugno 1938	**Fornaci e molini da gesso, calce e cemento** (comprese le cave di gesso, calce e cemento eventualmente annesse (1)).	190	75 75*bis*
143	idem	**Fornaci da laterizi** (comprese le cave di argilla per laterizi e di sabbia eventualmente annesse (1)).	191	76 76*bis*
144	idem	**Stabilimenti per la lavorazione di oggetti di grès e materiale refrattario.**	192	77
145	idem	**Industria della ceramica** (fabbriche di terrecotte, maioliche, terraglie e porcellane).	193	78 78*bis*
146	idem	**Stabilimenti per la lavorazione di oggetti in cemento, gesso, stucco e conglomerati fibrosi** (esclusa la fabbricazione di conglomerati a base di ritagli — residui legnosi — tipo « populit » e simili).	194	79 79*bis*
147	idem	**Stabilimenti per la fabbricazione degli abrasivi flessibili, rigidi e granulari o in pasta** (tele e carte abrasive, mole e altri conglomerati abrasivi, comprese le macine artificiali, ecc.).	195	80
148	idem	**Stabilimenti per la fabbricazione e lavorazione del vetro.**	196	81
149	idem	**Laboratori per lavori artistici in mosaico** (esclusi i lavori di pavimentazione).	197	82
		VIII. - INDUSTRIE EDILIZIE		
—	31 luglio 1938	**Imprese edilizie** (comprendono).	—	197
150	idem	**Opere di edilizia in genere** (civili, militari, rurali, industriall) **in muratura ed in cemento armato e relative fondazioni ; lavori di demolizione ; lavori vari di rifinimento, manutenzione e restauro degli edifici.**	208	196
151	idem	**Lavori di terra e opere stradali.**	209	196
152	idem	**Lavori di armamento ferroviario e tramviario.**	210	196
153	idem	**Opere di galleria.**	211	196
154	idem	**Opere di sistemazione e di bonifica idraulica ; costruzione di acquedotti, fognature, ecc.**	212	196
155	idem	**Opere per impianti idroelettrici e per utilizzazione di acque.**	213	196
156	idem	**Lavori portuali e opere marittime.**	214	196
150*bis*	idem	**Artigiani edili.**	208	196*bis*
		IX. - INDUSTRIE CHIMICHE		
157	30 giugno 1938	**Industrie chimico-estrattive e chimico-mineralurgiche.**	225	83
158	idem	**Industria delle polveri da caccia, da mina e prodotti pirotecnici.**	236	94
159	idem	**Industrie dei prodotti azotati e dell'alcole metilico sintetico.**	226	84
160	idem	**Industria dell'acido solforico, dei concimi fosfatici, dell'acido fosforico, del fosforo e derivati. Industrie affini** (solfiti, bisolfiti, ecc., colle ed altri derivati delle ossa e del sangue ; escluse quelle vegetali).	227	85
161	idem	**Industria degli anticrittogamici e degli antiparassitari per uso agricolo** (comprese le raffinerie di solfo).	228	86
162	idem	**Industria della soda, della potassa, del cloro e suoi principali derivati, e deli l'acido cloridrico, per reazione e per sintesi, suoi sali e derivati** (esclusi - prodotti ottenuti dalla lavorazione delle acque madri e delle saline : sottoclasse 157 ; e la produzione di potassa ottenuta dal guscio di mandorle).	229	87
163	idem	**Industrie elettrotermiche** (esclusa l'eventuale annessa produzione di ferro leghe e di acetato di manganese — per catalizzatori).	231	89
164	idem	**Industrie dell'acido acetico, suoi sali e derivati ; dell'acetone ; dell'alcole metilico** (escluso il sintetico : sottoclasse 159), **butilico è dèrivati ; dei prodotti di esterificazionè** (solventi e plastificanti) (esclusa la produzione di cicloesanolo).	232	90

(1) Cfr. nota (3) a pag. 79*.

N. d'ordine definitivo della sottoclasse	DATA DI CENSIMENTO	CLASSI E SOTTOCLASSI	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue: **IX. - Industrie chimiche.**		
165	31 agosto 1938	**Industrie dell'alcole etilico di 1ª categoria e del lievito di fermentazione** (esclusa la produzione del lievito di birra ottenuto come sottoprodotto nelle fabbriche di birra ; la produzione di lieviti non da fermentazione ; i lieviti eventualmente prodotti da istituti farmaceutici ; la produzione di etere etilico (etere solforico) e l'eventuale produzione di carbonati, bicarbonati, ecc.).	233	91
166	30 giugno 1938	**Industrie degli olii minerali, miscele lubrificanti ed affini** (esclusa la produzione di emulsioni bituminose a base di bitume di carbone o miste ; e la produzione di antiparassitari, o insetticidi a base di olii minerali).	234	92
167	idem	**Industria della distillazione del carbone fossile, dei derivati ed affini** (compresa la lignite) (compresa la produzione ed esclusa la distribuzione di gas illuminante).	235	93
168	idem	**Industria dei fiammiferi.**	237	95
169	idem	**Industria dei gas compressi** (1) (esclusa la produzione e la compressione dei gas ottenuta come lavorazione accessoria o secondaria).	238	96
170	idem	**Industrie dei prodotti sensibili per fotografia e cinematografia.**	239	97
171	idem	**Industria dei colori organici sintetici e dei relativi prodotti intermedi** (esclusa la produzione di colori inorganici, di pigmenti e di colori vegetali per concia e tinta).	240	98
172	idem	**Industria dei prodotti ausiliari per l'industria tessile, tintoria e conciaria** (esclusi : i prodotti saponosi : sottoclasse 174 ; gli estratti per concia e tinta : sottoclasse 180 ; gli acidi naftenici : sottoclasse 166 ; i riconcianti e i concianti minerali : sottoclasse 180 ; gli amidi : sottoclasse 175).	241	99
173	idem	**Industrie della idrogenazione degli olii e grassi** (vegetali e animali) **e della lavorazione dei grassi** (compresa la produzione di margarina ed esclusa la lavorazione di grasso alimentare e la lavorazione di grasso di ossa ottenuta nelle fabbriche di concimi, colle, ecc.).	242	100
174	idem	**Industria dei saponi, glicerina, candele ed affini** (compresa la lavorazione della morchia di olive ; esclusi i prodotti non saponosi, ausiliari per l'industria tessile : sottoclasse 172 ; e la produzione di glicerina ottenuta dai residui della fermentazione e distillazione di materiali zuccherini-melassi).	243	101
175	idem	**Industrie degli amidi, destrine, glutine, colle vegetali e glucosio** (esclusa la produzione di appretti e materie ausiliarie per le industrie tessili, conciarie e tintorie ; la produzione di altre colle (di ossa, ecc.) ; e la produzione di olio di germe di granturco).	244	102
176	idem	**Industrie delle profumerie** (esclusi i saponi profumati : sottoclasse 174), **dei prodotti da toletta e degli estratti per liquori** (esclusa la produzione dei profumi sintetici : sottoclasse 176 *bis* ; delle essenze aromatiche : sottoclasse 177 ; e delle essenze agrumarie : sottoclasse 178).	245	103
176*bis*	idem	**Industrie dei profumi sintetici e costituenti di essenze** (escluse : la produzione di profumerie e dei prodotti da toletta : sottoclasse 176 ; la produzione di essenze naturali aromatiche e da profumo : sottoclasse 177).	245*bis*	104
177	idem	**Industria delle essenze aromatiche e da profumo e del succo di liquirizia** (escluse le essenze agrumarie : sottoclasse 178).	246	105
178	31 maggio 1938	**Industria dei derivati agrumari** (2).	247	55 56
179	30 giugno 1938	**Industria tartarica** (esclusa la eventuale produzione eseguita accessoriamente nelle distillerie di 2ª categoria).	248	106
180	idem	**Industria degli estratti per concia e tinta e dei concianti minerali** (esclusa la produzione di « tannini puri » dalle noci di galla).	249	107
181	idem	**Industrie dei prodotti farmaceutici sintetici ed affini e dei prodotti chimici farmaceutici vari.**	250	108
181*bis*	idem	**Industrie dei preparati farmaceutici galenici** (esclusi i prodotti farmaceutici sintetici : sottoclasse 181 ; i profumi sintetici : sottoclasse 176*bis* ; le essenze aromatiche e da profumo : sottoclasse 177) ; **delle specialità farmaceutiche** (compresi i prodotti biologici, i sieri ed i vaccini) **ed alimentari varie ; dei prodotti deodoranti, igienici, disinfettanti ed insetticidi vari** (esclusi i saponi medicinali ; i prodotti da toletta e gli antiparassitari per uso agricolo).	250*bis*	109

(1) Compresi gli esercizi che acquistano gas non compressi e che li comprimono per la vendita ed esclusi quelli che acquistano gas già compressi in bombole per rivenderli (attività commerciale).

(2) Compresa la lavorazione presso aziende agrarie o familiari anche se modestamente attrezzate dal punto di vista industriale (macchinari di tipo semplice e limitati in numero e in capacità produttiva) esclusa la lavorazione di agrumi eseguita negli esercizi commerciali, come attività accessoria, e le lavorazioni eseguite presso le fabbriche di profumi come operazioni preliminari alla preparazione dei profumi stessi.

N. d'ordine definitivo della sottoclasse	DATA DI CENSIMENTO	CLASSI E SOTTOCLASSI	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue; **IX. - Industrie chimiche.**		
182	30 giugno 1938	**Industria della cellulosa** (esclusa la produzione di mezze paste di paglia, stracci, ecc. : sottoclasse 191).	251	110
183	idem	**Industria delle materie plastiche e resine sintetiche** (esclusa la produzione di ebanite).	252	111
184	idem	**Industrie dei colori inorganici, pigmenti, neri e lacche.**	253	112
185	idem	**Industrie delle vernici, pitture ed affini.**	254	113
186	idem	**Industria degli inchiostri da stampa e da scrivere, colle confezionate** (escluse le colle vegetali e le colle animali), **ceralacche ed affini ; cuscinetti per timbri.**	255	114
187	idem	**Industria delle creme e lucidi per pavimenti, metalli, mobili, calzature - Prodotti vari per calzaturifici ed affini.**	256	115
188-189	idem	**Industrie chimiche diverse** (1).	257-258	116 132
		X. - INDUSTRIE DELLA CARTA E AFFINI		
190	31 ottobre 1938	**Deposito e classifica della carta da macero, degli stracci e dei cascami per l'industria della carta.**	264	134
191	idem	**Fabbricazione delle paste meccaniche di legno, delle mezze paste, della carta e del cartone** (escluse la patinatura, coloritura, paraffinatura : sottoclasse 192 ; e la cartotecnica : sottoclasse 193).	265	135 135*bis*
192	idem	**Patinatura, coloritura e verniciatura della carta e dei cartoni ; fabbricazione delle carte da parati e delle carte da giuoco.**	266	136
193	idem	**Industrie operatrici della carta e dei cartoni** (compreso l'eventuale annesso reparto grafico che lavori prevalentemente per l'esercizio e l'eventuale annessa produzione di articoli in cellofane e in celluloide ; escluse la patinatura, incatramatura, ecc. e la fabbricazione delle carte da parati e delle carte da giuoco : sottoclasse 192 ; la fabbricazione di cartelle, album, scatole, agende, ecc. annessa ad esercizi di legatoria e rilegatoria di libri).	267	137
194	idem	**Fabbricazione di oggetti di cartapesta.**	268	138
195	idem	**Produzione di carta carbone, inchiostratura di nastri per macchine da scrivere e fabbricazione di matrici per duplicatori.**	269	139
196	idem	**Produzione di fibra vulcanizzata.**	270	140
		XI. - INDUSTRIE POLIGRAFICHE E AFFINI		
197	idem	**Stabilimenti e laboratori di arti grafiche** (comprese le annesse legatorie e gli annessi laboratori fotografici).	281	141
198	idem	**Legatorie e rilegatorie** (escluse quelle annesse a stabilimenti tipografici).	283	142 142*bis*
199	idem	**Stabilimenti, laboratori e studi fotografici** (compresi i laboratori di fotoceramistica e simili e le lavorazioni eliografiche, cianografiche e simili).	284	143
200	idem	**Uffici di copisteria e affini.**	285	144
		XII. - INDUSTRIE DEL CUOIO, DELLE PELLI E DEI LORO SUCCEDANEI, DELLE CALZATURE E DEI GUANTI IN PELLE		
201	idem	**Lavorazione** (concia e tintura) **delle pelli per pelliccerie** (escluse la confezione delle pelliccerie : sottoclasse 251 ; la sola conservazione delle pellicce e la sola essiccazione delle pelli di coniglio).	311	165 165*bis*
202	idem	**Concerie** (compresi gli esercizi che eseguono esclusivamente la tintura e/o la rifinitura ; escluse la concia e tintura delle pelli per pelliccerie : sottoclasse 201 ; e la salatura e conservazione delle pelli).	312	166
203	idem	**Fabbriche di cuoi artificiali da detriti di pelli e di cuoio.**	313	167

(1) In questa sottoclasse sono stati censiti gli esercizi che fabbricano prodotti chimicamente definiti, ma che non figurano in nessun'altra sottoclasse (ad esempio : produzione di canfora sintetica, solfuro di carbonio, alcoli alifatici superiori, idrogenati di idrocarburi, sali di metalli preziosi, spugne per catalisi, acido lattico e mannite sintetica, permanganato potassico, esplosivi, ecc.) o che pur figurando in altre sottoclassi come prodotti secondari, accessori o complementari rappresentano lavorazioni autonome e principali (ad es. : esercizi che producono solo benzochinone, idrochinone o alcuni nitrati di ferro, di piombo, ecc.).

N. d'ordine definitivo della sottoclasse	DATA DI CENSIMENTO	CLASSI E SOTTOCLASSI	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue; **XII. - Industrie del cuoio, delle pelli e del loro succedanei, delle calzature e dei guanti in pelle.**		
204	31 ottobre 1938	**Fabbriche di cinghie ed articoli di selleria e buffetteria.**	314	168 168*bis*
205	idem	**Fabbriche di pelletterie ed articoli di valigeria : in pelle, imitazione pelle e surrogati pelle** (pegamoide, tessuti vari, ecc.) (comprese : la produzione di materiale liscio, decorato o sbalzato in pelle, imitazione pelle e surrogati pelle per cornici, sottomano, ecc. ; e la produzione di marocchini per cappelli, berretti, caschi, ecc.).	315	169 169*bis*
206	idem	**Calzaturifici** (esclusi gli esercizi specializzati nella produzione di calzature esclusivamente o prevalentemente in gomma : sottoclasse 266 ; e quelli che eseguono esclusivamente la riparazione con mezzi elettro-meccanici : sottoclasse 206*bis*).	316	170 170*bis*
206*bis*	idem	**Laboratori per l'esclusiva o prevalente riparazione a macchina di calzature** (compreso l'eventuale annesso servizio di lustrascarpe).	316*bis*	171
207	idem	**Fabbriche di guanti in pelle.**	317	172
		XIII. - INDUSTRIE TESSILI		
208	30 giugno 1938	**Stabilimenti per la produzione del seme-bachi.**	328	117
209	idem	**Impianti per la essiccazione dei bozzoli** (esclusi quelli annessi agli stabilimenti per la produzione del seme-bachi : sottoclasse 208).	329	118
210	31 ottobre 1938	**Trattura della seta e filatura dei bozzoli doppi** (esclusa la eventuale annessa : a) torcitura della seta : sottoclasse 211 ; b) tessitura della seta : sottoclasse 212 ; c) tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237).	331	148
211	idem	**Torcitura della seta, di fibre tessili artificiali e di altre fibre** (esclusa la eventuale annessa : a) trattura della seta : sottoclasse 210 ; b) tessitura della seta : sottoclasse 212 ; c) tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237), **produzione di filati cucirini e da ricamo** (esclusa la rifinitura e confezione dei filati cucirini e da ricamo).	332	149
212	idem	**Tessitura della seta, delle fibre tessili artificiali e tessitura della seta con altre fibre** (compresa la eventuale annessa produzione di tessuti di maglia ; esclusa la eventuale annessa : a) trattura della seta : sottoclasse 210 ; b) torcitura della seta : sottoclasse 211 ; c) tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237).	333	150 150*bis*
213	idem	**Macerazione, pettinatura e filatura dei cascami di seta e bourettes ; pettinatura e filatura delle fibre tessili artificiali (in fiocco)** (esclusa la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237).	334	151
214	idem	**Classificazione degli stracci, ritagli e cascami e produzione delle fibre rigenerate** (escluse : a) le lavorazioni esercitate negli stabilimenti per la filatura della lana rigenerata : sottoclasse 218, o per la filatura del cotone : sottoclasse 215, o nelle cartiere : sottoclasse 190 ; b) la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237).	336	152
215	idem	**Filatura e ritorcitura del cotone** (e dei suoi cascami) **puro o misto ad altre fibre** (fiocco di raion, di canapa, ecc.) (compresa la produzione di filati cucirini ; la fabbricazione di ovatta di cotone puro o misto ad altre fibre ; esclusa : a) la eventuale annessa tessitura : sottoclasse 216 ; b) la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237 ; c) i cascamifici cotonieri che limitano la propria attività esclusivamente alla classificazione degli stracci, ritagli e cascami o alla produzione delle fibre rigenerate).	337	153
216	idem	**Tessitura del cotone** (e dei suoi cascami) **puro o misto ad altre fibre** (compresa : a) la eventuale annessa produzione di tessuti di maglia ; b) la eventuale annessa finitura chimico-sanitaria di cotonati sanitari ; esclusa: a) la eventuale annessa filatura e/o ritorcitura : sottoclasse 215 ; b) la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237).	338	154
217	idem	**Pettinatura della lana** (pura o mista con altre fibre) **e di altre fibre tessili** (esclusa la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237).	339	155
217*bis*	idem	**Filatura della lana pettinata** (pura o mista con altre fibre) **e di altre fibre tessili** (esclusa la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura : sottoclasse 237).	339*bis*	156

Segue: *Appendice V — Classificazione delle Industrie e dei Servizi*

N. d'ordine definitivo della sottoclasse	Data di censimento	Classi e sottoclassi	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue: **XIII. - Industrie tessili.**		157
218	31 ottobre 1938	**Preparazione e filatura cardata della lana vergine o rigenerata** (pura o mista con altre fibre) **e di altre fibre tessili** (esclusa la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura: sottoclasse 237).	340	158
219	idem	**Lavatura meccanica della lana per materassi** (compresa la eventuale lavatura e carbonizzazione della lana tessile; escluso: a) la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura: sottoclasse 237; b) i reparti di lavatura annessi alle pettinature della lana: sottoclasse 217).	342	159
220	idem	**Tessitura della lana** (pettinata, cardata, vergine o rigenerata) **pura o mista con altre fibre** (compresa la eventuale annessa produzione di tessuti di maglia; esclusa la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura: sottoclasse 237).	343	160
221	idem	**Lavatura, cardatura e filatura a mano della lana; tessitura a mano; tessitura meccanica a carattere artigiano** (esclusa la tessitura a carattere casalingo).	344	161
222	idem	**Produzione di feltri battuti di lana e di pelo** (escluso: a) i feltri per cappelli: sottoclasse 238; b) la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura: sottoclasse 237).	345	162
223	idem	**Industria delle fibre tessili artificiali, del trasparente di cellulosa e simili** (compresa la tintura in pasta e la scelta e l'imballaggio delle fibre tessili artificiali; esclusa la eventuale annessa tintoria, candeggio, stampa, mercerizzazione e rifinitura: sottoclasse 237; la eventuale annessa filatura e ritorcitura delle fibre tessili artificiali).	346	119 119*bis*
224	30 giugno 1938	**Fabbricazione di tessuti di maglia** (esclusa quella eventualmente annessa ai lanifici, setifici e cotonifici; compresa la eventuale annessa confezione di indumenti di maglia); **fabbricazione di maglieria, di guanti in maglia, di calze** (con eventuali annesse lavanderie e stirerie).	347	120 120*bis*
225	idem	**Stabilimenti per la pettinatura del lino e della canapa e per la filatura del lino, della canapa, delle fibre dure, del ramiè e simili, puri o misti con altre fibre.**	348	163
225*bis*	30 settembre 1938	**Macerazione e stigliatura del lino.**	348*bis*	121 121*bis*
226	30 giugno 1938	**Stabilimenti per la tessitura del lino, della canapa e del ramiè, puri o misti con altre fibre ed eventuale confezionatura** (esclusa la rifinitura dei tessuti).	349	122
227	idem	**Stabilimenti per la disintegrazione e cotonizzazione della canapa e di altre fibre.**	350	123
228	idem	**Stabilimenti per la filatura e tessitura della iuta pura o mista con altre fibre** (compresa la eventuale annessa confezione di sacchi, escluse le lavorazioni di filati di iuta effettuate nelle fabbriche di spaghi e cordami).	351	124 124*bis*
229	idem	**Fabbriche di spaghi e cordami di cotone, canapa, manilla e simili, puri o misti con altre fibre - Fabbriche di reti da pesca e da caccia.**	352	125 125*bis*
230	idem	**Fabbriche di passamanerie di moda, militari, ecclesiastiche, ecc.** (compresi gli eventuali annessi laboratori di ricamo; le eventuali annesse lavorazioni dei tirati metallici e la doratura e argentatura per mezzo di processi galvanoplastici).	353	126 126*bis*
231	idem	**Stabilimenti per la produzione di tulli, veli, merletti, ricami, pizzi, trecce e pizzi trecciati, stringhe, nastri e simili** (compresa la eventuale annessa produzione di nastri elastici; esclusa la produzione di nastri tubolari di seta).	354	127
232	idem	**Verniciatura dei tessuti e simili; fabbriche di tele cerate; preparazioni speciali; fabbriche di linoleum** (esclusa la impermeabilizzazione dei tessuti).	356	128
233	idem	**Fabbriche di tappeti da terra** (tessuti ed annodati — escluse le stuoie, i tappeti da tavola e gli arazzi di qualsiasi tipo; la eventuale annessa tintoria).	357	129
234	idem	**Stabilimenti per la produzione di accessori non metallici per la filatura e la tessitura** (compresi gli scardassi).	358	130
235	idem	**Fabbriche di nastri e tessuti elastici** (compresa la eventuale annessa confezione di articoli di tessuto elastico).	359	131
236	idem	**Stabilimenti per la filatura e tessitura dell'amianto, la produzione di cartoni e di altri articoli di amianto.**	360

N. d'ordine definitivo della sottoclasse	Data di censimento	Classi e sottoclassi	N. d'ordine provvisorio della sottoclasse	N. del modello di questionario
		Segue; **XIII. - Industrie tessili.**		
237	31 ottobre 1938	**Tintoria, candeggio, stampa, mercerizzazione, coesionatura, rifinitura di qualsiasi tessile in straccio, fiocco, nastro, filato, tessuto** (escluso il candeggio e la tintura delle fibre artificiali durante le operazioni di produzione, ecc. : sottoclasse 223).	361	164
		XIV. - INDUSTRIE DEL VESTIARIO, ABBIGLIAMENTO, ARREDAMENTO E AFFINI (esclusa la fabbricazione di oggetti in cuoio, in pelle e di calzature in pelle : classe XII).		
238	31 dicembre 1938	**Preparazione del pelo per cappelli ; fabbricazione di feltri per cappelli ; fabbricazione di trecce di truciolo e di paglia ; fabbricazione di cappelli e berretti** (compresa la pressatura e la formatura dei cappelli per conto terzi ; esclusi la fabbricazione di feltri battuti non per cappelli : sottoclasse 222 ; e i laboratori per la lavatura, smacchiatura, stiratura, ecc., compresa la eventuale annessa guarnizione dei cappelli : sottoclasse 252).	372	204 204*bis* 204*ter*
239	idem	**Laboratori di modisteria.**	373	205 205*bis*
240	idem	**Laboratori per la confezione di abiti.**	374	206 206*bis*
241	idem	**Fabbricazione di calzature non in pelle** (compresa la fabbricazione eventuale di calzature in pelle purchè di importanza secondaria in confronto alla fabbricazione di calzature non in pelle ; esclusa la fabbricazione eseguita presso fabbriche e laboratori di calzature in pelle : sottoclasse 206).	375	207
242	idem	**Laboratori per la confezione di biancheria** (compresa la eventuale annessa : a) confezione di indumenti in maglia ; b) confezione di busti e simili ; esclusa la confezione di biancheria eseguita negli stabilimenti per la tessitura del lino, della canapa e del ramiè).	376	208 208*bis*
243	idem	**Laboratori da materassaio e tappezziere in stoffa e affini** (anche se annessi a negozi di vendita) (compresa la eventuale annessa fabbricazione di fusti in legno per poltrone, divani e simili ; esclusa : a) la lavatura della lana da materassi : sottoclassi 219 e 221 ; b) la preparazione delle piume e del crine : sottoclasse 262).	377	209
244	idem	**Laboratori per la confezione di busti e simili** (compresi i laboratori annessi a negozi di vendita, di busti ortopedici ; escluso : a) i laboratori annessi a fabbriche di tessuti elastici : sottoclasse 235 ; b) la confezione di busti e simili eseguita presso i laboratori per la confezione di biancheria : sottoclasse 242).	378	210
245	idem	**Fabbricazione di ombrelli.**	379	211
246	idem	**Laboratori per la confezione di accessori del vestiario** (cravatte, bretelle, ghette, ecc.) (esclusa la produzione di tessuti elastici : sottoclasse 235).	380	212
247	idem	**Fabbricazione di guarnizioni per abiti, di fiori artificiali e oggetti di ornamento e arredamento** (compresa la fabbricazione artistica di bottoni, fibbie, pendagli ed altri oggetti (in osso, materie plastiche, legno, avorio, ecc.) per guarnizioni di abiti e affini ; esclusa la confezione di oggetti vari per abbigliamento (in corozo, palma dum).	381	213
248	idem	**Produzione di bottoni** (compresa la eventuale annessa produzione accessoria di bottoni di legno ; esclusi i bottoni : a) di osso, di avorio, corno, unghia : sottoclasse 261 ; b) di cuoio, pelle : sottoclasse 205 ; c) di vetro : sottoclasse 148 ; d) di porcellana : sottoclasse 145 ; e) di metallo : sottoclasse industrie meccaniche ; f) di legno, qualora questi ultimi non costituiscono una produzione accessoria eventualmente annessa all'esercizio : sottoclasse 25).	382	214
249	idem	**Laboratori per la confezione di bandiere, vele, gagliardetti e simili - Fabbricazione e riparazione di sacchi di iuta non eseguite negli iutifici.**	383	215
250	idem	**Fabbricazione di guanti in stoffa o in tessuto di maglia** (esclusa : a) la eventuale annessa produzione di guanti in maglia fabbricati con macchine rettilinee : sottoclasse 224 ; b) la produzione di tessuti di maglia in pezza e di altri tessuti : classe XIII).	384	216
251	idem	**Laboratori per la confezione di pelliccerie.**	385	217
252	idem	**Lavanderie, stirerie, smacchiatorie e tintorie ; laboratori di rammendo** (compresi i laboratori di smacchiatura, lavatura e stiratura di cappelli, non annessi a negozi di vendita).	386	218
253	idem	**Confezione di parrucche e lavorazione di capelli umani** (comprese quelle effettuate presso i negozi di parrucchiere).	387	219

		Segue: **XIV. - Industrie del vestiario, abbigliamento, arredamento e affini.**		
254	31 dicembre 1938	**Lavorazione delle penne e delle piume da ornamento** (esclusa la lavorazione delle penne e delle piume per imbottitura anche con eventuale annessa lavorazione delle penne e delle piume da ornamento).	388	220
255	idem	**Imbiancatura e tintoria della paglia, del truciolo, del giunco, della rafia, ecc.** (escluse quelle annesse a fabbriche di oggetti in paglia, truciolo, giunco, rafia, ecc.: sottoclassi 26 e 27).	389	221
		XV. - INDUSTRIE FONO-CINEMATOGRAFICHE		
256	idem	**Stabilimenti di produzione di filmi** (compresi gli stabilimenti o studi cinematografici sperimentali dei G.U.F., dell'O.N.D., ecc.).	404	245
257	idem	**Stabilimenti per la sincronizzazione e il doppiaggio di filmi** (compresi gli stabilimenti o studi cinematografici sperimentali dei G.U.F., dell'O.N.D., ecc.).	405	246
258	idem	**Stabilimenti di sviluppo e stampa di filmi** (compresi gli stabilimenti o studi cinematografici sperimentali dei G.U.F., dell'O.N.D., ecc.).	406	247
259	idem	**Industria della incisione ed edizione fonografica** (esclusa la fabbricazione e stampa dei dischi: sottoclasse 260).	408	249
260	idem	**Fabbricazione e stampa di dischi fonografici** (esclusa l'incisione dei dischi: sottoclasse 259).	409	250
		XVI. - INDUSTRIE VARIE		
261	31 ottobre 1938	**Fabbricazione di oggetti in corno, osso, unghia, corallo, madreperla, avorio, tartaruga e simili (ambra, ecc.)** (esclusi i bottoni e le fibbie di madreperla e trocas: sottoclasse 248; e le armature per occhiali: sottoclasse 280).	430	175
262	idem	**Lavorazione delle setole, del crine animale, del pelo e di fibre vegetali; del capoc, delle penne, delle piume per imbottiture** (compresa la eventuale annessa preparazione delle fibre vegetali; escluse la confezione di materassi, cuscini, ecc.: sottoclasse 243; la fabbricazione di scope: sottoclasse 28).	431	176
263	idem	**Produzione di spazzole, spazzolini e pennelli** (compresa la produzione di piumini da cipria e la eventuale annessa preparazione delle materie prime impiegate nell'esercizio).	432	177
264	idem	**Fabbricazione di timbri di gomma** (esclusi i datari e i numeratori metallici) e **di smaltografie** (esclusi i distintivi smaltati e gli smalti artistici).	433	178
265	idem	**Produzione di cavi e di conduttori elettrici isolati** (esclusa la lavorazione della gomma elastica: sottoclasse 266; e gli eventuali laminatoi e trafilerie annessi: sottoclasse 74).	434	179
266	idem	**Industria della gomma elastica e della guttaperca** (compresa la produzione di oggetti e calzature in gomma e di maschere antigas; la produzione dei rigenerati di gomma; esclusi la confezione di impermeabili, vestiti, calzettoni, calzoni, bretelle, giarrettiere, pancere, busti, ecc., in tessuti gommati: classe XIV; e i laboratori per l'esclusiva vulcanizzazione (riparazione di oggetti di gomma).	435	180
267	idem	**Fabbricazione di strumenti musicali** (compresa la produzione esclusiva di accessori e parti staccate di strumenti musicali; escluse le ocarine in terracotta: sottoclasse 145).	436	251
268	idem	**Fabbricazione di giocattoli** (esclusa la fabbricazione di giocattoli di metallo o prevalentemente di metallo, effettuata presso le officine di ferramenta e minuterie metalliche: sottoclasse industrie meccaniche; nonchè quella giocattoli di legno, di cartapesta, di stoffa, di celluloide, ecc., eventualmente già censita).	437	252
269	idem	**Laboratori di vulcanizzazione di oggetti di gomma** (riparazione di pneumatici, stivali, stivaloni; esclusa la riparazione (vulcanizzazione) di suole di gomma nelle calzature in pelle).	438	181
270	idem	**Fabbricazione di materiali dielettrici** (esclusa la produzione di resine sintetiche: sottoclasse 183; di isolanti stampati con polveri a base di resine sintetiche: sottoclasse 271; e di isolanti in vetro: sottoclasse 148; porcellana: sottoclasse 145; ebanite e simili: sottoclasse 266).	439	182
271	idem	**Fabbricazione di oggetti in materie plastiche** (esclusi i bottoni, le fibbie: sottoclasse 248; e le armature per occhiali: sottoclasse 280) **ed in fibra vulcanizzata** (esclusa la produzione di valigie: sottoclasse 205).	440	183

		Segue: **XVI. - Industrie varie.**		
272	31 ottobre 1938	**Fabbriche di penne stilografiche, di pennini con punta di iridio e di matite automatiche** (escluse le matite automatiche in metallo o prevalentemente in metallo : sottoclasse industrie meccaniche).	441	184
273	idem	**Industria del tabacco.**	442	185
273*bis*	idem	**Stagionatura, selezione e imbottamento delle foglie di tabacco** (concessionari di coltivazione tabacchi).	442*bis*	186
274	idem	**Fabbricazione di lampade elettriche, lampade e tubi luminescenti, valvole termoioniche e bottiglie isolanti** (compresa la produzione dei soli filamenti di carbone ; esclusa la produzione di ampolle, tubi ed aste di vetro ; la produzione di filamenti metallici per lampade elettriche ; la fabbricazione di trasformatori, apparecchi per radiotelefonia e radiotelegrafia, strumenti per misure elettriche e radioelettriche).	443	188
275	idem	**Laboratori per la montatura in serie di occhiali** (esclusa la montatura eseguita accessoriamente dagli ottici e dagli esercizi che producono le armature per occhiali).	444	189
276	idem	**Preparazione e lavorazione della carta-pecora e delle budella ; imbalsamazione, preparazione delle spugne** (compresa l'imbalsamazione di animali per musei, collezionisti, ecc. ; esclusa l'imbalsamazione di cadaveri).	445	190
277	idem	**Scaricamento, ripristino e caricamento di proiettili ; caricamento di proiettili da lancio a mano, da artiglierie, da aerei, di cariche di rinforzo per detti, di mine, torpedini subacquee e di siluri** (compreso l'eventuale caricamento di artifizi).	446	191
278	idem	**Confezionamento di elementi di colpo per artiglierie** (compresa la carica di lancio) ; **fabbricazione di cartucce per armi da guerra, da difesa e da caccia** (compresa la preparazione della miscela fulminante e l'eventuale confezionamento di capsule).	447	192
279	idem	**Produzione di manichini e di materiali didattici** (compresa la produzione di busti da sartoria in cartapesta eseguita accessoriamente ; esclusa la produzione esclusiva di oggetti, statue, ecc., in cartapesta, in gesso, e la produzione di solidi geometrici e di modelli cristalloscopici in legno : sottoclasse 25).	448	193
280	idem	**Fabbricazione di armature per occhiali, di occhiali e di astucci per occhiali** (esclusa la produzione di lenti e di vetri : sottoclasse 148).	449	194
		XVII. - PRODUZIONE E DISTRIBUZIONE DI FORZA MOTRICE E DISTRIBUZIONE DI GAS E ACQUA		
281	31 dicembre 1938	**Esercizio di impianti per la generazione, il trasporto e la distribuzione di energia elettrica.**	418	334
282	31 ottobre 1938	**Esercizio di impianti per la distribuzione di gas** (escluse le officine di produzione di gas illuminante e le sorgenti di gas naturale).	419	173
283	idem	**Esercizio di impianti per la distribuzione di acqua potabile e non potabile** (esclusi i consorzi per la distribuzione di acqua esclusivamente per l'irrigazione dei fondi dei consorzisti).	420	174
		B) SERVIZI		
		XVIII. - ATTIVITÀ EDITORIALI E AGENZIE DI STAMPA (*)		
284	idem	**Edizioni di libri comuni e artistici ; edizioni periodiche ; edizioni musicali** (1).	296	145
285	idem	**Edizioni di stampe varie** (1).	299	146
286	idem	**Agenzie di stampa** (1).	300	147
		XIX. - IMPRESE DELLO SPETTACOLO		
287	31 dicembre 1938	**Imprese per l'esercizio di teatri, di sale per spettacoli, di cinema-teatri, cinematografi, ecc.** (compresi i locali per spettacoli all'aperto ; esclusi i tabarini e i caffè-concerto).	399	240

(*) Unità di censimento sono state considerate : la casa madre-sede centrale delle aziende editoriali e delle agenzie di stampa ; gli autori-editori di proprie pubblicazioni ; gli enti ed uffici pubblici ; i commercianti-editori.

(1) Erano soggetti al censimento in questione le aziende private e gli enti pubblici che svolgevano, in via continuativa o saltuaria, attività editoriale per edizioni di pubblicazioni destinate in tutto o in parte alla vendita ; così ad es. : tra gli enti pubblici dovevano essere censiti i Consigli Provinciali delle Corporazioni per le edizioni dei bollettini dei prezzi, dei bollettini ufficiali, delle relazioni, ecc. ; le Prefetture per le edizioni dei fogli degli annunzi legali e dei bollettini ufficiali ; dovevano essere invece escluse le edizioni reclamistiche, i cataloghi ed i listini di aziende industriali e commerciali ; le edizioni di bilanci comunali e di modulame in genere per enti pubblici e privati.
