MISURE DELLA FECONDITA' ITALIANA
NEGLI ULTIMI TRENTA ANNI (*)

1. Il presente volume contiene due serie di dati.

La prima, dettagliata a livello territoriale (1), e' relativa ai quozienti di fecondita' specifici per singola eta' della madre - nonché per classi di eta' - dal 1952 al 1979 ed ai corrispondenti valori (annuali) del tasso lordo di riproduzione (Tavv. 1-10) (2).

La seconda, riferita al complesso del Paese, riguarda i valori mensili del tasso lordo di riproduzione per gli anni dal 1971 al 1981, valori che costituiscono i risultati di un nuovo metodo di calcolo di recente messo a punto da Gerard Calot, Direttore dell'Institut National d'Etudes Démographiques di Parigi, cortesemente posti a disposizione dell'ISTAT (Cfr. Prosp. 1). Inoltre, sempre per il periodo 1971-81, vengono pubblicati i valori annuali del tasso lordo di riproduzione relativi al gruppo di Paesi per i quali Calot ha condotto un'elaborazione analoga a quella italiana. Per gli stessi Paesi si dispone ovviamente anche di dati mensili (Cfr. Prosp. 2).

Il materiale che viene presentato sara' in futuro regolarmente aggiornato e, per quanto riguarda l'indicatore mensile, elaborato anche almeno a livello di ripartizione geografica.

2. Serie di tassi specifici di fecondita' sono state pubblicate dall'ISTAT a piu' riprese (3) ma i dati che vengono ora forniti si differenziano in piu' punti dai precedenti, per quanto riguarda il dettaglio dell'eta', il riferimento territoriale, la popolazione femminile considerata ed anche il metodo di calcolo.

Per la prima volta infatti sono stati elaborati quozienti per singola eta' della madre a livello di regione. Inoltre, per gli anni dal 1952 al 1970, come popolazione di riferimento e' stata assunta quella ricostruita a posteriori in base alle risultanze censuarie al 1961 e 1971 (4). Per gli anni successivi invece si e' fatto ricorso alla popolazione residente anagrafica che, come e' noto, da qualche anno l'ISTAT regolarmente distribuisce per sesso e singolo anno di eta' (5).

Le novita' in merito alle modalita' di elaborazione hanno riguardato i nati vivi illegittimi che, relativamente alle regioni, sono correntemente pubblicati sommati ai nati morti e solo per classi di eta' della madre. La distribuzione per singolo anno di eta' e' stata stimata ricorrendo ad un

.....

metodo cae, anche per la rapidità di esecuzione, trova frequente applicazione qualora si presenti la necessità di stimare dati singoli a partire da dati raggruppati in classi, nell'ipotesi che l'andamento dei successivi valori raggruppati sia indicativo dell'andamento dei valori all'interno di ciascuna classe. Si tratta del metodo dei moltiplicatori di Sprague che, in campo demografico, è spesso utilizzato per il passaggio dalla struttura della popolazione per classi pluriennali di età a quella per singole età. Il metodo consiste essenzialmente in un procedimento d'interpolazione per punti noti e di esso è fornita una sintetica descrizione nell'Appendice A (6).

Ovviamente, l'applicazione indipendente del metodo di Sprague ai dati regionali sui nati vivi illegittimi ha comportato il problema della mancata concordanza tra la distribuzione, a livello Italia, dei nati vivi illegittimi per singola età della madre ottenuta per aggregazione dei dati regionali stimati e l'analoga pubblicata dall'ISTAT. Si è trattato quindi di rielaborare i valori ottenuti con il suddetto procedimento interpolatorio, in ciò applicando il cosiddetto metodo RAS, ideato da Richard Stone, che in generale risolve il problema della stima dei valori interni di una tabella doppia - della quale siano note soltanto la riga e la colonna marginali - sulla base di un'analoga tabella integralmente riempita. Per la descrizione del metodo si veda l'Appendice B.

Come già in occasione delle serie precedentemente pubblicate, i quozienti hanno riferimento ai nati vivi della popolazione residente, la cui ripartizione per singola età della madre, non nota, è stata eguagliata a quella dei nati vivi della popolazione presente, desunta dallo spoglio delle schede individuali di nascita.

3. Il calcolo del tasso lordo di riproduzione con il metodo corretto (come somma cioè dei quozienti di fecondità per singola età della madre) richiede la conoscenza di un elemento - la distribuzione dei nati vivi per età della madre - che, solitamente, si rende disponibile a distanza di uno-due anni dall'epoca di riferimento. Recentemente Calot ha proposto - ed applicato, come già ricordato, per un gruppo di Paesi europei ed extraeuropei - un nuovo metodo di calcolo che, in quanto basato sulla conoscenza dello ammontare totale mensile dei nati vivi, permette da una parte di calcolare l'indicatore con una maggiore tempestività (ad esempio, per l'Italia, valori provvisori sull'ammontare mensile delle nascite della popolazione residente divengono noti a distanza di tre-quattro mesi) e dall'altra di disporre di indicatori su base mensile e non solo annuale, la qual cosa risulta particolarmente utile anche in indagini retrospettive per cogliere il momento esatto delle variazioni del fenomeno. Rimandando all'articolo originale per una illustrazione completa del metodo (7), è sufficiente in questa sede ricordarne i caposaldi:
 - a) è stata innanzi tutto trasformata la formula di calcolo dell'indicatore (annuale), ottenuto non più come somma dei quozienti specifici di fecondità ma come rapporto tra ammontare assoluto delle nascite e numero medio di donne viventi in ogni singola età dell'intervallo fecondo ("effectif de la génération moyenne"). In particolare tale ultimo valore risulta pari alla media aritmetica ponderata dell'ammontare (medio annuo) dei diversi contingenti di generazioni di donne in età feconda nel periodo di osservazione, avendo assunto come pesi la serie dei relativi quozienti di fecondità, calcolati per generazione (8);
 - b) tenuto conto che la conoscenza esatta del denominatore del suddetto rapporto non è mai contemporanea a quella del numeratore, si è provveduto a stimarlo assumendolo uguale all'ultimo valore calcolabile sulla base di elementi certi (9), corretto a sua volta con il valore extrapolato alla data di riferimento dell'errore che, relativamente ai periodi precedenti, sarebbe stato commesso qualora il dato esatto fosse stato sostituito con uno stimato (10);

c) in analogia alla espressione trasformata dell'indicatore annuale, i tassi lordi di riproduzione mensili si otterranno riferendo all'ammontare mensile delle nascite (i valori registrati vengono opportunamente destagionalizzati e perequati) un numero medio (mensile) di donne viventi in ogni singola età dell'intervallo fecondo stimato per interpolazione dei dati annuali.

4. Senza voler entrare nel merito dei complessi fattori che hanno concorso a determinare le profonde variazioni della fecondità nel corso dell'ultimo decennio -su tali fattori vasta è la letteratura esistente (11)- appare utile in questa sede porre in rilievo sinteticamente le principali differenze, nei livelli e nelle tendenze evolutive, che emergono dai dati calcolati da Calot con riferimento ai principali Paesi europei e ad alcuni grandi Paesi extraeuropei (cfr. Prosp. 2) (12):

a) a livello di aree geografiche europee, molto diversificate risultano le tendenze della fecondità nel corso degli anni settanta. Mentre nell'Europa Meridionale la diminuzione è stata pressoché continua nel decennio, in quelle Settentrionale ed Occidentale da tre-quattro anni si può parlare di arresto della diminuzione. Nell'Europa Orientale infine si è registrata una evoluzione totalmente opposta: aumento, anche consistente, fino alla metà del decennio e successivamente decremento che ha riportato la fecondità a livelli simili a quelli iniziali;

b) non mancano situazioni che si discostano dalle tendenze medie sopra indicate. Tale è il caso dell'Inghilterra-Galles e, parzialmente, della Francia, per le quali più che di arresto si potrebbe parlare di ripresa della fecondità (in Inghilterra tra il 1977 ed il 1980 il tasso di riproduzione è aumentato del 13%); in Grecia, invece, i valori del tasso di riproduzione da un decennio oscillano intorno alla soglia di 2300 (13);

c) le suddette diversità di dinamica che la fecondità ha presentato nei vari Paesi hanno prodotto una sensibile modificazione nella graduatoria degli stessi secondo i valori dell'indicatore. Tipici al riguardo sono, per un verso, il caso dell'Italia e, in senso opposto, i casi della Cecoslovacchia, dell'Ungheria e della Grecia. L'Italia in dieci anni ha raggiunto livelli di fecondità così bassi (il valore del tasso è, secondo la stima al 1981, inferiore a 1600) da essere stati toccati solo da un ristrettissimo numero di Paesi a fecondità tradizionalmente bassa (Danimarca, Germania Federale, Olanda e Svizzera). Per converso, l'Ungheria e la Cecoslovacchia, che nel 1971 presentavano valori inferiori a quelli di numerosi Paesi dell'Europa Settentrionale ed Occidentale, occupano attualmente posti tra i più alti in una graduatoria secondo valori crescenti;

d) per tutti i Paesi considerati il livello attuale del tasso lordo di riproduzione risulta inferiore a quello del 1971, con una variazione tra il 20% ed il 30% in nove casi ed in tre (Norvegia, Italia e Olanda) superiore al 30%. Significativa è inoltre la circostanza che attualmente, nell'ambito dei Paesi considerati, i valori inferiori a 2000 (indicativi di popolazioni con tendenza al regresso numerico) (14) sono nettamente i più frequenti, mentre rari erano all'inizio del decennio;

e) passando ai Paesi extraeuropei, la situazione registrata negli Stati Uniti è molto simile a quella inglese, con livelli che dopo il 1976 hanno iniziato a crescere, anche se in misura molto più contenuta. In Australia, Canada e Giappone invece è in epoca recentissima che comincia a manifestarsi un certo rallentamento nella diminuzione del tasso lordo di riproduzione.

A P P E N D I C E A

Il metodo dei moltiplicatori di Sprague

1. E' noto che, data una serie di punti, il problema della stima dei valori intermedi ad essi viene usualmente risolto facendo passare tratti di curva continua per successivi gruppi dei punti suddetti (15). Tale procedimento puo' portare all'inconveniente che la serie dei valori interpolati presenti delle discontinuita' nei punti di raccordo delle successive curve interpolanti. Sono stati pertanto introdotti criteri di interpolazione -detti osculatori- che, imponendo la condizione che i segmenti di curva adiacenti assumano nei punti d'incontro le stesse derivate prima e seconda (cioe' abbiano la stessa tangente e lo stesso raggio di curvatura), assicurano la continuita' dei valori interpolati (16). Il metodo dei moltiplicatori di Sprague trae origine da una formula interpolatoria introdotta secondo i suddetti criteri osculatori (17).

2. La derivazione della formula interpolativa di Sprague puo' essere sintetizzata nel modo seguente.
Siano dati sei punti equispaziati sull'asse delle ascisse:

$$(0, u_0) \quad (1, u_1) \quad (2, u_2) \quad \dots \quad (5, u_5)$$

Il problema e' quello di trovare l'equazione di una polinomiale del 5° ordine che presenti le seguenti caratteristiche:

- a) passi per i due punti $(2, u_2)$ e $(3, u_3)$;
- b) nel punto $(2, u_2)$ le sue derivate prima e seconda siano uguali alle derivate prima e seconda della polinomiale del 4° ordine passante per i primi cinque punti dati;
- c) la stessa condizione precedente sia verificata relativamente al punto $(3, u_3)$ ed alla polinomiale del 4° ordine passante per i punti dal secondo al sesto.

Pertanto, se l'equazione generica della polinomiale e'

$$u_{2+x} = u_2 + ax + bx^2 + cx^3 + dx^4 + ex^5, \quad (0 \leq x \leq 1)$$

nei punti di ordinata u_2 ($x = 0$) e u_3 ($x = 1$) le sue derivate prima e seconda saranno rispettivamente:

$$\begin{aligned} u_2' &= a & u_3' &= a + 2b + 3c + 4d + 5e \\ u_2'' &= 2b & u_3'' &= 2b + 6c + 12d + 20e \end{aligned} \quad <1>$$

ed il passaggio per il punto $(3, u_3)$ comportera' la relazione:

$$u_3 - u_2 = a + b + c + d + e = \Delta u_2 = \Delta u_0 + 2 \Delta^2 u_0 + \Delta^3 u_0 \quad <2>$$

Peraltro, le due suddette polinomiali del 4° ordine (18), derivate rispettivamente in u_2 e u_3 , forniranno i seguenti valori:

$$\begin{aligned} u_2' &= \Delta u_0 + 3/2 \Delta^2 u_0 + 1/3 \Delta^3 u_0 - 1/12 \Delta^4 u_0 \\ u_2'' &= \Delta^2 u_0 + \Delta^3 u_0 - 1/12 \Delta^4 u_0 \\ u_3' &= \Delta u_0 + 5/2 \Delta^2 u_0 + 11/6 \Delta^3 u_0 + 1/4 \Delta^4 u_0 - 1/12 \Delta^5 u_0 \\ u_3'' &= \Delta^2 u_0 + 2 \Delta^3 u_0 + 11/12 \Delta^4 u_0 - 1/12 \Delta^5 u_0 \end{aligned} \quad \langle 3 \rangle$$

Dalle relazioni <1>, <2> e <3> si desumono i valori dei due parametri 'a' e 'd':

$$\begin{aligned} a &= \Delta u_0 + 3/2 \Delta^2 u_0 + 1/3 \Delta^3 u_0 - 1/12 \Delta^4 u_0 \\ b &= 1/2 \Delta^2 u_0 + 1/2 \Delta^3 u_0 - 1/24 \Delta^4 u_0, \end{aligned}$$

mentre per gli altri parametri si tratterà di risolvere il sistema:

$$\begin{cases} c + d + e = 1/6 \Delta^3 u_0 + 1/8 \Delta^4 u_0 \\ 3c + 4d + 5e = 1/2 \Delta^3 u_0 + 5/12 \Delta^4 u_0 - 1/12 \Delta^5 u_0 \\ 6c + 12d + 20e = \Delta^3 u_0 + \Delta^4 u_0 - 1/12 \Delta^5 u_0 \end{cases}$$

che fornisce le seguenti espressioni:

$$\begin{aligned} c &= 1/6 \Delta^3 u_0 + 1/12 \Delta^4 u_0 + 7/24 \Delta^5 u_0 \\ d &= 1/24 \Delta^4 u_0 - 1/2 \Delta^5 u_0 \\ e &= 5/24 \Delta^5 u_0. \end{aligned}$$

Sostituendo nell'equazione generica si ottiene la formula interpolatoria di Sprague (19):

$$\begin{aligned} u_{2+x} &= u_2 + x \Delta u_0 + 1/2 x(x+3) \Delta^2 u_0 + 1/3! (x+2)(x+1)x \Delta^3 u_0 + \\ &+ 1/4! (x+2)(x+1)x(x-1) \Delta^4 u_0 + 1/4! x^3 (x-1)(5x-7) \Delta^5 u_0 \end{aligned} \quad \langle 4 \rangle$$

la quale, essendo $u_2 = u_0 + 2 \Delta u_0 + \Delta^2 u_0$, può essere scritta nella seguente altra forma:

$$\begin{aligned} u_{2+x} &= u_0 + (x+2) \Delta u_0 + 1/2 (x+2)(x+1) \Delta^2 u_0 + 1/3! (x+2)(x+1)x \Delta^3 u_0 + \\ &+ 1/4! (x+2)(x+1)x(x-1) \Delta^4 u_0 + 1/4! x^3 (x-1)(5x-7) \Delta^5 u_0. \end{aligned} \quad \langle 4' \rangle$$

Con tale formula pertanto si è in grado di stimare i valori interni di un intervallo delimitato da due punti dati sulla base di sei valori di cui i suddetti rappresentano i termini centrali. La formula inoltre, applicata a successivi intervalli, produce valori interpolati che si susseguono senza brusche variazioni. Infine, la formula stessa riproduce esattamente i dati di partenza.

3. La formula di Sprague, soprattutto in passato, ha trovato applicazione in campo attuariale e demografico ai fini della scomposizione di dati rag-

gruppati in classi. In tale ipotesi, rappresentando i valori di partenza delle aree e non dei punti, la formula <4'> va utilizzata non sui dati originari bensì su quelli cumulati, la qual cosa permette, come si vedrà, di operare delle trasformazioni che ne rendono estremamente semplice l'uso nella pratica.

Si supponga di disporre della successione dei seguenti valori:

$$y_0, y_5, y_{10}, y_{15}, y_{20}, y_{25}, \dots$$

$$\text{essendo } y_x = \sum_x^{x+4} w_x$$

Passando ai valori cumulati, cioè ai valori

$$u_m = \sum_0^{m-1} w_x$$

varranno le seguenti relazioni:

$$\Delta u_m = u_{m+5} - u_m = \sum_0^{m+4} w_x - \sum_0^{m-1} w_x = \sum_m^{m+4} w_x = y_m$$

$$\Delta u_0 = y_0$$

$$\Delta^2 u_0 = y_5 - y_0$$

<5>

$$\Delta^3 u_0 = y_{10} - 2y_5 + y_0$$

$$\Delta^4 u_0 = y_{15} - 3y_{10} + 3y_5 - y_0$$

$$\Delta^5 u_0 = y_{20} - 4y_{15} + 6y_{10} - 4y_5 + y_0$$

Peraltro, applicando la formula <4'> ai sei valori

$$u_0, u_5, u_{10}, u_{15}, u_{20}, u_{25}$$

per i valori i valori di x da 0 a 1 intervallati di 1/5, si otterranno i sei valori

$$u_{10}, u_{11}, u_{12}, u_{13}, u_{14}, u_{15}$$

moltiplicando u_0 e le successive differenze finite $\Delta u_0, \dots, \Delta^5 u_0$

per i coefficienti riportati nel quadro seguente:

| | u_0 | Δu_0 | $\Delta^2 u_0$ | $\Delta^3 u_0$ | $\Delta^4 u_0$ | $\Delta^5 u_0$ |
|----------|-------|--------------|----------------|----------------|----------------|----------------|
| u_{10} | +1 | +2 | +1 | - | - | - |
| u_{11} | +1 | +2.2 | +1.32 | +0.088 | -0.0176 | +0.0016 |
| u_{12} | +1 | +2.4 | +1.68 | +0.224 | -0.0336 | +0.0080 |
| u_{13} | +1 | +2.6 | +2.08 | +0.416 | -0.0416 | +0.0144 |
| u_{14} | +1 | +2.8 | +2.52 | +0.672 | -0.0336 | +0.0128 |
| u_{15} | +1 | +3 | +3 | +1 | - | - |

D'altro canto, essendo $u_{m+1} - u_m = \sum_0^m w_x - \sum_0^{m-1} w_x = w_m$, decumu-

lando i valori del quadro precedente si otterranno i seguenti coefficienti da utilizzare per pervenire ai valori cercati $u_{10}, u_{11}, u_{12}, u_{13}, u_{14}$:

| | u_0 | Δu_0 | $\Delta^2 u_0$ | $\Delta^3 u_0$ | $\Delta^4 u_0$ | $\Delta^5 u_0$ |
|----------|-------|--------------|----------------|----------------|----------------|----------------|
| w_{10} | - | + .2 | + .32 | + .088 | -.0176 | + .0016 |
| w_{11} | - | + .2 | + .36 | + .136 | -.0160 | + .0064 |
| w_{12} | - | + .2 | + .40 | + .192 | -.0080 | + .0064 |
| w_{13} | - | + .2 | + .44 | + .256 | + .0080 | -.0016 |
| w_{14} | - | + .2 | + .48 | + .328 | + .0336 | -.0128 |

Tenuto conto delle relazioni <5>, i valori w_{10}, \dots, w_{14} possono esprimersi in funzione dei dati di partenza y_x . In particolare si tratterà di moltiplicare una matrice $|A|$ a 5 righe e 5 colonne di coefficienti (i cosiddetti moltiplicatori) per un vettore colonna di 5 elementi, costituiti nel caso in esame dai valori $y_0, y_5, y_{10}, y_{15}, y_{20}$:

$$|A| \times \begin{pmatrix} y_0 \\ y_5 \\ y_{10} \\ y_{15} \\ y_{20} \end{pmatrix} = \begin{pmatrix} w_{10} \\ w_{11} \\ w_{12} \\ w_{13} \\ w_{14} \end{pmatrix}$$

dove

$$|A| = \begin{pmatrix} -.0128 & +.0848 & +.1504 & -.0240 & +.0016 \\ -.0016 & +.0144 & +.2224 & -.0416 & +.0064 \\ +.0064 & -.0336 & +.2544 & -.0336 & +.0064 \\ +.0064 & -.0416 & +.2224 & +.0144 & -.0016 \\ +.0016 & -.0240 & +.1504 & +.0848 & -.0128 \end{pmatrix}$$

La scomposizione dei successivi valori y_x fino al terzultimo della serie data avverrà allo stesso modo, tenendo presente che la suddetta matrice $|A|$ andrà moltiplicata per un vettore costituito da termini di cui quello da scomporre rappresenta il valore centrale.

Il descritto procedimento lascia irrisolto il problema della scomposizione dei primi due e degli ultimi due valori della serie di partenza. A tal fine, si procede all'interpolazione dei primi (e ultimi) cinque valori cumulati mediante una polinomiale del 4° ordine e, adottando un ragionamento analogo a quello indicato in precedenza, si perviene a scomposizioni sempre ottenute come prodotto tra matrici di moltiplicatori e vettori di dati di partenza. Più precisamente, si avrà indicando con y_m l'ultimo dato disponibile:

$$|A_1| \times \begin{pmatrix} y_0 \\ y_5 \\ y_{10} \\ y_{15} \end{pmatrix} = \begin{pmatrix} w_0 \\ w_1 \\ w_2 \\ w_3 \\ w_4 \end{pmatrix} \quad |A_2| \times \begin{pmatrix} y_0 \\ y_5 \\ y_{10} \\ y_{15} \end{pmatrix} = \begin{pmatrix} w_5 \\ w_6 \\ w_7 \\ w_8 \\ w_9 \end{pmatrix}$$

$$|A_3| \times \begin{pmatrix} y_{m-15} \\ y_{m-10} \\ y_{m-5} \\ y_m \end{pmatrix} = \begin{pmatrix} w_{m-5} \\ w_{m-4} \\ w_{m-3} \\ w_{m-2} \\ w_{m-1} \end{pmatrix} \quad |A_4| \times \begin{pmatrix} y_{m-15} \\ y_{m-10} \\ y_{m-5} \\ y_m \end{pmatrix} = \begin{pmatrix} w_m \\ w_{m+1} \\ w_{m+2} \\ w_{m+3} \\ w_{m+4} \end{pmatrix}$$

dove le matrici $|A_1|, \dots, |A_4|$ sono a 5 righe e 4 colonne (20).

A P P E N D I C E B

Il metodo RAS

Il metodo RAS, introdotto da Stone nel 1963 (21) e utilizzato soprattutto nel campo delle tavole intersettoriali dell'economia (22), permette di stimare i valori interni di una tabella doppia - della quale sono noti i totali di riga e di colonna - partendo da una tabella integralmente riempita.

Nel caso in esame, l'applicazione del metodo dei moltiplicatori di Sprague ai dati pubblicati sui nati vivi illegittimi per classi d'età della madre ha permesso di ottenere, per ognuno degli anni di riferimento considerati e per ognuna delle classi d'età $a_t - a_{t+h}$, una tabella come la seguente:

| età' | regioni | | | | | totale |
|------------------|------------------|------------------|------------------------|------------------------|--|------------------|
| | R ₀₁ | R ₀₂ | R _j | R ₂₀ | | |
| a _t | | | - | - | | x _t |
| . | | | . | . | | . |
| a _{t+i} | | | NI _{ij} | | | x _{t+i} |
| . | | | . | . | | . |
| a _{t+h} | | | - | - | | x _{t+h} |
| totale | NI ₀₁ | NI ₀₂ | NI _j | NI ₂₀ | | A |

Si tratta di stimare una tabella analoga, la cui riga marginale coincide con la precedente (totale regionale dei nati vivi illegittimi da madri aventi età della classe considerata) mentre la colonna marginale (totale italiano per ciascuna età della classe considerata) è diversa, essendo costituita dai valori pubblicati. Indichiamo con $y_t, \dots, y_{t+i}, \dots, y_{t+h}$

gli elementi di tale colonna marginale e con NI_{ij} il generico valore interno da stimare della tabella.

Si procede nel modo seguente:

- 1) dalla tabella di partenza si calcolano i rapporti

$$r_{ij} = NI_{ij} / x_{t+i} \quad (i=0, \dots, 4; j=01, \dots, 20)$$

che, applicati ai totali y_{t+i} , forniscono una prima stima degli elementi interni della tabella

$$NI_{ij}^{(0)} = r_{ij} y_{t+i}$$

- 2) una seconda stima $NI_{ij}^{(1)}$ si ottiene dai prodotti

$$NI_{ij}^{(0)} \quad (NI_j / NI_j^{(0)})$$

dove $NI_j^{(0)}$ e' pari alla somma per riga dei valori $NI_{ij}^{(0)}$ $(NI_j^{(0)} = \sum_i NI_{ij}^{(0)})$
Sara' inoltre evidentemente

$$\sum_i NI_{ij}^{(1)} = NI_j ;$$

3) una terza stima si ottiene dai prodotti

$$NI_{ij}^{(2)} = NI_{ij}^{(1)} \quad (Y_{t+i} / Y_{t+i}^{(0)})$$

essendo $Y_{t+i}^{(0)} = \sum_j NI_{ij}^{(1)}$ e $\sum_j NI_{ij}^{(2)} = Y_{t+i} ;$

4) la somma per riga dei valori $NI_{ij}^{(2)}$ puo' non coincidere con NI_j ; in tal caso si dovra' iterare i riproporzionamenti, per riga e per colonna,

fino a pervenire a valori $NI_{ij}^{(k)}$ tali che risultino contemporaneamente soddisfatte le relazioni

$$\begin{cases} \sum_i NI_{ij}^{(k)} = NI_j \\ \sum_j NI_{ij}^{(k)} = Y_{t+i} \end{cases}$$

o le differenze siano almeno di modesta entita' (una-due unita').

NOTE

- (1) I dati sono presentati distintamente per regione, per ripartizione geografica e per il complesso del Paese. E' da osservare che non per tutte le regioni i calcoli sono stati effettuati in modo omogeneo. Le particolarità sono sintetizzate nello schema seguente e derivano, per la Valle d'Aosta, dalla ridotta consistenza demografica della regione che ha sconsigliato di scendere troppo in dettaglio e, negli altri casi, dall'epoca di disponibilità dei dati di base.

- (2) I quozienti di fecondità per età della madre costituiscono una misura della frequenza delle nascite che consente corretti confronti temporali e spaziali in quanto svincolata da diversità nella struttura per età della popolazione femminile nell'ambito del periodo fecondo. Essi si ottengono riferendo l'ammontare (annuo) delle nascite vitali provenienti da madri di una data età (o classe d'età) alla semisomma della popolazione femminile avente l'età considerata all'inizio ed alla fine dell'anno di riferimento e moltiplicando il risultato per 1000. La somma dei quozienti, per tutte le età dell'intervallo fecondo, rappresenta un indice sintetico della fecondità largamente utilizzato per un'analisi congiunturale del fenomeno. Va sotto il nome di tasso lordo di riproduzione ed esprime il numero medio di figli per 1000 donne alle condizioni di fecondità dell'anno di riferimento. Per ulteriori dettagli sugli strumenti di analisi demografica per una corretta misura della fecondità e, in particolare, sulla possibilità di calcolo dei quozienti specifici per generazioni e per contemporanei - quali quelli qui presentati - e sulle interpretazioni da dare al tasso lordo di riproduzione si veda, ad esempio, M. LIVI BACCI, Introduzione alla demografia, Loescher Editore, Torino 1981, Cap. 10.

- (3) Nel 1969 l'ISTAT pubblico per la prima volta una serie di quozienti specifici di fecondità a livello regionale, calcolata nell'ambito delle elaborazioni effettuate ai fini delle previsioni della popolazione regionale al 1981 (Cfr. ISTAT, Tendenze evolutive della popolazione delle regioni italiane fino al 1981, a cura di F. GIUSTI e M. NATALE, Note e Relazioni, n. 41, Roma 1969, pagg. 164-169). La serie partiva dal 1952 e si arrestava al 1964, con un dettaglio quinquennale per quanto concerne l'età della donna al momento del parto. Successivamente la serie venne aggiornata fino al 1971 e presentata in Appendice all'Annuario di Statistiche Demografiche (Cfr. ISTAT, Annuario di Statistiche Demografiche, vol XXI, Edizione 1971-72, Roma 1974, pagg.

222-223) che da allora riporta regolarmente i dati relativi all'anno di riferimento. Un'altra serie di tassi, questa volta riferita all'Italia nel complesso ma distintamente per singolo anno d'età della madre, venne approntata dall'ISTAT ai fini delle previsioni demografiche presentate nel 1978 (Cfr. ISTAT, Proiezioni della popolazione residente italiana al 1981, 1986 e 1991, Supplemento al Bollettino mensile di Statistica, Anno 1978, n. 12, pagg. 20-21). La serie riguardava il periodo 1952-73 e presentava la particolarità di considerare l'età della madre riferita non, come usuale, al momento del parto (ed espressa in anni compiuti) ma al 1° gennaio dell'anno in cui avviene la nascita.

- (4) Per il periodo intercensuario 1952-61 la ricostruzione è stata effettuata dall'Ufficio Studi sulla Popolazione dell'ISTAT; per il periodo successivo si è fatto ricorso ai dati elaborati dall'Istituto di Demografia dell'Università di Roma, cortesemente messi a disposizione.
- (5) Cfr. ISTAT, Popolazione residente per sesso, età e regione, Anni 1972, 1973, 1974 e 1975, Supplemento al Bollettino mensile di Statistica, n. 10 ottobre 1976. Per gli anni successivi si vedano i Supplementi n. 11 del 1978 e n. 11 del 1981. Quando saranno disponibili i dati sulla struttura per sesso età e regione della popolazione residente censita al 1981 e quindi sarà possibile ricostruire la serie suddetta, si procederà ovviamente a ricalcolare i quozienti ora presentati a partire dal 1972.
- (6) Il metodo porta in generale a risultati soddisfacenti e solo nel caso in cui i dati da scomporre si susseguono irregolarmente andrebbe sostituito da altri metodi, ad esempio da una interpolazione grafica, che è certamente più flessibile di quella analitica.
- (7) Cfr. G. CALOT, L'observation de la fécondité a court et moyen terme, in INED, "Population", n. 1, 1981.
- (8) Con riferimento ad un dato anno di calendario n , il quoziente di fecondità relativo all'età x calcolato per generazione risulterà pari al rapporto tra l'ammontare delle nascite da madri nate nell'anno $n-x$ (che raggiungono l'età considerata nel corso dell'anno) e la semisomma delle sopravvivenenti della generazione di donne nate nell'anno $n-x$ all'inizio ed alla fine dell'anno n . Pertanto, mentre nei quozienti per contemporanei l'età è da intendersi espressa in anni compiuti, in quelli per generazione sono considerate le età precise.
- (9) Più precisamente, si supponga di disporre di dati esatti sui quozienti di fecondità e sulla ripartizione per età della popolazione femminile relativamente ad i anni prima rispetto a quello di riferimento n . Se si ipotizza che nel corso dei suddetti i anni la mortalità ed i movimenti migratori non abbiano apportato variazioni numeriche, il contingente di popolazione femminile che, nato nell'anno $n-x$, a metà dell'anno n ha età x potrà essere eguagliato a quello che, a metà dell'anno $n-i$, aveva $x-i$ anni di età. Applicando a tali contingenti la serie dei quozienti di fecondità per età dell'anno $n-i$ (la qual cosa sottintende l'ipotesi dell'invarianza nel corso degli i anni della profezione alla procreazione nelle varie età), si ottiene una prima stima del denominatore.

Come lo stesso Calot ricorda nel suo lavoro, l'idea di esprimere il tasso lordo di riproduzione quale rapporto tra ammontare delle nascite e tale stima dell'effectif de la génération moyenne, riprende un concetto formulato nel 1931 dal Gini e applicato alla determinazione del numero medio di figli per matrimonio. Il Gini infatti propose di di calcolare tale misura come rapporto tra le nascite (legittime) verificatesi in un dato anno ed un numero annuo virtuale di matrimoni, pari ad una media ponderata di tutti i contingenti di matrimoni che avevano dato luogo alle nascite considerate, laddove il sistema dei pesi - mancando all'epoca la possibilità di desumerlo correntemente dalle statistiche disponibili - venne calcolato in base ad una indagine prestabilita ad hoc ed applicato inalterato per anni diversi (Cfr. C. GINI, Di un procedimento per la determinazione del numero medio dei figli per matrimonio, Relazione presentata al Congresso Internazionale per gli Studi sulla Popolazione, Roma 1931 ed anche ISTITUTO CENTRALE DI STATISTICA DEL REGNO D'ITALIA, Movimento della popolazione secondo gli atti dello stato civile nell'anno 1928, Appendice (a cura di C. GINI) "Sulla determinazione del numero medio dei figli legittimi per matrimonio", Roma 1932).

- (10) In altri termini, con riferimento ad un certo numero di anni precedenti a $n-i$, si possono confrontare i valori esatti dell'ammontare della generazione media con quelli stimabili nel modo precedentemente indicato sulla base delle informazioni disponibili relative all'anno $n-i$. Extrapolando all'anno n la serie degli errori che si commettono in tal modo, si ottiene un fattore di aggiustamento che consente di pervenire ad una seconda stima del denominatore.
- (11) Sulla storia della fecondità in Italia negli ultimi due secoli si veda M. LIVI BACCI, A history of italian fertility during the last two centuries, Princeton 1977 (il volume è stato recentemente tradotto in italiano con il titolo "Donne, fecondità e figli", Ed. Il Mulino, Bologna 1980). Sulle tendenze recenti si veda, tra gli altri, M. LIVI BACCI, Sull'incidenza economica e sociale delle tendenze demografiche, Relazione redatta per incarico del Ministero del Bilancio e della Programmazione Economica, Settembre 1980; AA. VV., Rapporto sulla popolazione italiana, a cura del Comitato Nazionale per i Problemi della Popolazione, Istituto dell'Enciclopedia Italiana, Roma 1980; P. DE SANDRE, Primi risultati dell'indagine nazionale sulla fecondità, C.N.R., Roma 17 marzo 1981. Per quanto riguarda gli altri Paesi si veda P. FESTY, La fécondité des pays occidentaux (1870-1970), INED/PUP, Travaux et Documents, Canier n. 85, Paris 1979 e A. MONNIER, L'Europe et les pays développés d'Outre-Mer, INED, Population, n. 4-5, Paris 1979.
- (12) Con qualche eccezione sono rappresentati i Paesi di maggior peso demografico di tutte le aree geografiche europee. Per l'Europa Meridionale manca la Jugoslavia, per quella Orientale la Polonia, la Repubblica Democratica Tedesca e la Bulgaria. Per quanto riguarda i Paesi extraeuropei, oltre che per Israele (con dati distinti per la popolazione ebraica e non), sono presentati i valori del tasso di riproduzione per l'Australia, il Giappone, gli Stati Uniti d'America ed il Canada (nonché per la regione del Quebec). Peraltro, le elaborazioni non possono considerarsi concluse e quindi in futuro si potrà disporre dell'indicatore congiunturale per un numero sempre più ampio di Paesi.

(13) Tra i casi anomali potrebbe citarsi anche quello della Repubblica Democratica Tedesca (Paese, come detto, non considerato nei calcoli di Calot), in cui la fecondità ha fatto registrare fino al 1975 una sensibilissima riduzione e successivamente un aumento molto sostenuto (Cfr. A. MONNIER, L'Europe et les pays....., op. cit.).

(14) Sul significato previsionale attribuibile al tasso di riproduzione si veda N. FEDERICI, Istituzioni di demografia, Parte I, Casa Editrice ELIA, Roma 1979.

(15) Per la ricerca di un polinomio di grado $n-1$ interpolatore di n punti distinti (x_i, y_i) si può, in generale, risolvere il sistema di n equazioni lineari in n incognite ottenuto imponendo che le coordinate dei punti assegnati soddisfino l'equazione della polinomiale:

$$p(x) = a_0 + a_1 x + a_2 x^2 + \dots + a_{n-1} x^{n-1}$$

Si può anche ricorrere a formule semplificate tra le quali si può ricordare la formula di Gregory-Newton valida per punti tra loro equidistanti e introducente le differenze finite (Δ) di vario ordine di una funzione. Data una successione di valori $y_0, y_1, \dots, y_i, \dots$, si definisce differenza prima relativa al termine y_i (Δy_i) la differenza $y_{i+1} - y_i$, differenza seconda ($\Delta^2 y_i$) la differenza tra successive differenze prime $\Delta y_{i+1} - \Delta y_i = y_{i+2} - 2y_{i+1} + y_i$, e così via.

(16) Sull'interpolazione osculatoria si veda ad esempio H. H. WOLFENDEN, Population statistics and their compilation, Society of Actuaries, University of Chicago Press, 1954.

(17) Tra le varie formule di interpolazione osculatoria introdotte si può ricordare quella di Karup utilizzata per la perequazione delle tavole di mortalità (Cfr. A. DEL CHIARO, Analisi delle distribuzioni statistiche, Boringhieri, 1960).

(18) Le loro equazioni, espresse con la formula di Gregory-Newton per punti equidistanti, sono date rispettivamente da:

$$u_0 + x \Delta u_0 + 1/2 x(x-1) \Delta^2 u_0 + 1/3! x(x-1)(x-2) \Delta^3 u_0 + 1/4! x(x-1)(x-2)(x-3) \Delta^4 u_0$$

$$u_1 + (x-1) \Delta u_1 + 1/2 (x-1)(x-2) \Delta^2 u_1 + 1/3! (x-1)(x-2)(x-3) \Delta^3 u_1 + 1/4! (x-1)(x-2)(x-3)(x-4) \Delta^4 u_1$$

(19) Cfr. T. B. SPRAGUE, Explanation of a new formula for interpolation, Journal of the Institute of Actuaries, vol. XXII, p. 270, 1880.

(20) Per le matrici $|A_1|, \dots, |A_4|$, si veda ad esempio H.S. SHRYOCK, J. S. SIEGEL, The methods and materials of demography, U.S. Department of Commerce, Bureau of the Census, Washington 1973, Vol. II,

App. C.

Principali pubblicazioni ISTAT

PUBBLICAZIONI PERIODICHE

Bollettino mensile di statistica

La più completa ed autorevole raccolta di dati continuamente aggiornati concernenti tutti i più notevoli aspetti dell'andamento demografico, sociale, economico e finanziario, anche con ampi riferimenti all'andamento internazionale.
Abbonamento annuo L. 32.000 (per l'estero: L. 38.000). Ogni fascicolo L. 3.800.

Indicatori mensili

Forniscono in anticipo sulla normale data di pubblicazione notizie riassuntive, dati e grafici relativi all'andamento mensile dei principali fenomeni interessanti la vita nazionale (ultimo numero disponibile, agosto-settembre 1982)
Abbonamento annuo L. 11.000 (per l'estero: L. 15.000). Ogni fascicolo L. 1.200.

Statistica mensile del commercio con l'estero

Unica documentazione statistica ufficiale sul commercio dell'Italia con l'estero; fornisce, per tutte le merci comprese nella classificazione merceologica della tariffa dei dazi doganali, l'andamento mensile delle importazioni e delle esportazioni da e per i principali paesi. (ultimo numero disponibile, aprile 1982)
Abbonamento annuo L. 55.000 (per l'estero: L. 62.000). Ogni fascicolo L. 6.500.

Notiziario ISTAT

Fornisce essenziali e tempestivi dati di prima mano sugli sviluppi della congiuntura economica nel campo della produzione agraria e industriale, dei prezzi, dei trasporti, del commercio interno, degli scambi internazionali, come pure dati relativi alle statistiche demografiche, sanitarie e sociali, dati che vengono poi pubblicati in forma più analitica nel «Bollettino mensile di statistica» e nella «Statistica mensile del commercio con l'estero».

Serie 1 - Statistiche demografiche e sociali; abbonamento annuo L. 7.000 (estero: L. 11.000) una copia L. 400.

Serie 2 - Statistiche dell'attività produttiva; abbonamento annuo L. 24.000 (estero: L. 33.000) una copia L. 400.

Serie 3 - Statistiche del lavoro, delle retribuzioni e dei prezzi; abbonamento annuo L. 8.000 (estero: L. 12.000) una copia L. 400.

Serie 4 - Argomenti vari; abbonamento annuo L. 4.000 (estero: L. 6.000) una copia L. 400.

Tutte le serie: abbonamento annuo L. 42.000 (per l'estero L. 57.000).

ABBONAMENTI CUMULATIVI A TUTTI I PERIODICI

— compresa la «Statistica mensile del commercio con l'estero»: abbonamento annuo L. 126.000 (per l'estero L. 160.000)

— esclusa la «Statistica mensile del commercio con l'estero»: abbonamento annuo L. 85.000 (per l'estero L. 115.000)

Gli abbonamenti decorrono dal 1° gennaio anche se sottoscritti nel corso dell'anno. In tal caso l'abbonato riceverà i numeri dell'annata già pubblicati. L'abbonato ai periodici ISTAT ha diritto a ricevere gratuitamente i fascicoli non pervenutigli soltanto se ne segnalerà il mancato arrivo entro 10 giorni dal ricevimento del fascicolo successivo. Decorso tale termine, si spediscono solo contro rimessa dell'importo. Le variazioni di indirizzo devono essere segnalate dall'abbonato per iscritto. Gli abbonati a tutti i periodici hanno diritto allo sconto del 50% sul prezzo di copertina per l'acquisto di una sola copia di altre pubblicazioni non periodiche dell'ISTAT edite nel corso dell'anno in cui è stato sottoscritto l'abbonamento. Le pubblicazioni possono essere richieste direttamente all'Istituto Centrale di Statistica (Via Cesare Balbo, 16 - 00100 Roma) versando il relativo importo, maggiorato di L. 500 per imposta di bollo se superiore a L. 10.000, sul c/c postale n. 619007).

PUBBLICAZIONI ANNUALI

- | | |
|--|----------|
| Annuario statistico italiano - edizione 1981 | L. 8.500 |
| Classica e fondamentale pubblicazione, riporta in forma organica e completa tutti i dati riflettenti i molteplici aspetti della complessa attività nazionale nel campo sociale, economico e finanziario. Contiene, inoltre, aggiornati dati statistici internazionali. | |
| Compendio statistico italiano - edizione 1982 | » 4.500 |
| Sintetizza, in semplici tabelle numeriche di facile lettura ed attraverso appropriate note illustrative e rappresentazioni grafiche, i dati fondamentali della vita economica, demografica e sociale e fornisce un quadro panoramico della corrispondente situazione degli altri principali Paesi del mondo. | |
| I conti degli Italiani - volume XV - edizione 1981 | » 2.500 |
| Illustra in forma divulgativa i principali aspetti quantitativi dell'economia italiana. | |
| Annuario di statistiche demografiche - volume XXVIII - edizione 1979 | » 7.500 |
| Comprende tutte le statistiche sui fenomeni demografici riguardanti il movimento della popolazione secondo gli atti dello stato civile, nonché sugli espatriati e rimpatriati. | |
| Popolazione e movimento anagrafico dei Comuni - volume XXV - edizione 1981 | » 7.500 |
| Contiene, distintamente per Comune, i dati del movimento e dell'ammontare della popolazione residente alla fine dell'anno, nonché numerose tavole riepilogative ed altre concernenti le iscrizioni e cancellazioni anagrafiche per trasferimento di residenza, per provincia, all'interno e con l'estero. Infine è riportato l'elenco delle variazioni territoriali avvenute durante l'anno. | |

| | | |
|---|----|----------------------|
| Annuario di statistiche sanitarie - volume XXIII - edizione 1978 | L. | 18.000 |
| Riunisce le statistiche sulle cause di morte, sulle strutture e sull'attività degli Istituti di cura, sulle malattie infettive e diffuse soggette a denuncia obbligatoria, sui nati deformati e sugli aborti. | | |
| Annuario statistico dell'assistenza e della previdenza sociale - volume XXII - edizione 1976-77-78 | » | 12.000 |
| Pubblicazione nella quale vengono statisticamente illustrati i principali aspetti dell'assistenza sociale in Italia ed alcune forme di attività svolte dai vari Istituti nel settore della previdenza sociale. | | |
| Annuario statistico dell'istruzione - volume XXXII - edizione 1980 | | |
| Tomo I - Dati analitici: nazionali, regionali e provinciali | » | 8.500 |
| Tomo II - Dati riassuntivi comunali | » | 5.500 |
| Quadro statistico completo ed aggiornato della situazione scolastica del Paese, attraverso dati sui vari rami d'insegnamento esaminati sotto i più interessanti aspetti dell'ordinamento degli studi e dei risultati conseguiti dagli iscritti. | | |
| Annuario delle statistiche culturali - volume XXII - edizione 1981 | » | 6.000 |
| Documentazione ufficiale completa sulle principali attività culturali concernenti; tra l'altro, la produzione libraria, la pubblicazione di riviste scientifiche, la stampa periodica e le biblioteche. | | |
| Annuario di statistiche giudiziarie - volume XXVII - edizione 1978-79 | » | 8.500 |
| Ampia documentazione statistica dell'attività giudiziaria nonché dei principali fenomeni in materia civile, penale, nel campo della criminalità e degli Istituti di prevenzione e pena. | | |
| Annuario di statistica agraria - volume XXVII - edizione 1980 | » | 8.500 |
| Riunisce i dati significativi dell'economia agricola italiana con particolare riguardo alle coltivazioni. | | |
| Annuario di statistica forestale - volume XXXIII - edizione 1981 | » | 6.000 |
| Fornisce un quadro completo sulla struttura delle foreste italiane e delle relative utilizzazioni legnose, unitamente ad alcuni aspetti economici. | | |
| Annuario di statistiche meteorologiche - volume XX - edizione 1980 | » | 7.000 |
| Raccoglie i dati relativi alle temperature, piovosità e altri fattori climatici rilevati da una rete di stazioni ed osservatori distribuiti nel territorio nazionale. | | |
| Annuario statistico della zootecnia, pesca e caccia - volume XXI - edizione 1980 | » | 5.000 |
| Riporta i più recenti dati sulla consistenza e produttività degli allevamenti, sull'attività della pesca e su alcuni aspetti del settore venatorio. | | |
| Annuario di statistiche industriali - volume XXIII - edizione 1979-80 | » | 8.000 |
| Nel suo genere, unica e veramente preziosa pubblicazione in cui sono organicamente raccolte tutte le informazioni statistiche fondamentali concernenti il complesso ed importante settore dell'industria. | | |
| Annuario statistico dell'attività edilizia e delle opere pubbliche - volume XXIV - edizione 1979-80 | » | 7.000 |
| Statistica ufficiale dedicata esclusivamente al settore dell'attività edilizia e delle opere pubbliche effettuate dallo Stato e da Enti pubblici, nonché da privati con finanziamento parziale dello Stato. | | |
| Annuario statistico del commercio interno e del turismo - volume XXII - edizione 1979 | » | 8.500 |
| Fornisce i risultati delle rilevazioni correnti relativi al fenomeno della distribuzione. Vi figurano gli indici mensili delle vendite al minuto, una estesa analisi dell'attività alberghiera e del turismo, nonché la più recente distribuzione per Comune delle licenze di esercizio. | | |
| Annuario statistico della navigazione marittima - volume XXXV - edizione 1981 | » | 10.000 |
| Contiene i dati statistici sul movimento dei natanti e del relativo carico avvenuto nei porti marittimi e negli altri approdi autorizzati del territorio nazionale. | | |
| Statistica degli incidenti stradali - volume XXIX - edizione 1981 | » | 6.500 |
| La più completa ed aggiornata raccolta di dati su una materia di viva attualità. | | |
| Statistica annuale del commercio con l'estero - volume XXXVII - edizione 1980 | | |
| Tomo I - Dati generali e riassuntivi | | (in corso di stampa) |
| Tomo II - Merci per Paesi | L. | 23.000 |
| Riporta i dati definitivi sull'andamento delle importazioni e delle esportazioni con l'analisi completa del movimento per merci e per Paesi. Nel Tomo primo è riportata, tra l'altro, un'ampia documentazione sul movimento delle merci nei depositi doganali e sul commercio di transito. | | |
| Statistiche dei bilanci delle amministrazioni regionali, provinciali e comunali - volume XXIII - edizione 1975 | » | 6.000 |
| Espone i dati relativi ai bilanci delle Amministrazioni, tenendo conto dell'aspetto contabile, funzionale ed amministrativo dei documenti contabili. Per le Amministrazioni provinciali e comunali è stata dedicata particolare attenzione ai dati riguardanti i servizi sociali, i settori d'intervento nel campo economico ed il personale. | | |
| Annuario di statistiche del lavoro - volume XXII - edizione 1981 | » | 8.000 |
| Organica ed aggiornata documentazione statistica su tutti i principali aspetti del mondo del lavoro. | | |
| Annuario di contabilità nazionale - volume X - edizione 1980-81 | | |
| Tomo I - Dati nazionali 1979-80 | » | 7.000 |
| Tomo II - Parte A - Dati territoriali 1979 | » | 7.000 |
| Tomo II - Parte B - Dati territoriali 1980 | » | 7.000 |
| Contiene i dati sulla struttura ed evoluzione delle principali grandezze del sistema economico italiano. | | |
